

# NodeRED RoboCamp: From Hero to Superhero

Building IoT applications with UNO+WiFiShield and NodeRED

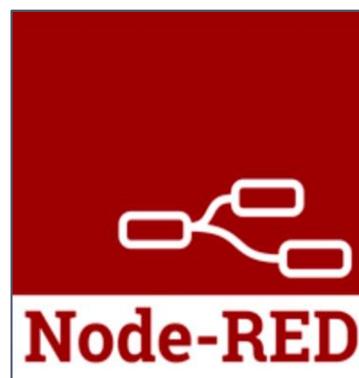

# Introduction to Node-RED

Web-based Visual Programming Tools  
Wiring of the Internet of Things Programming

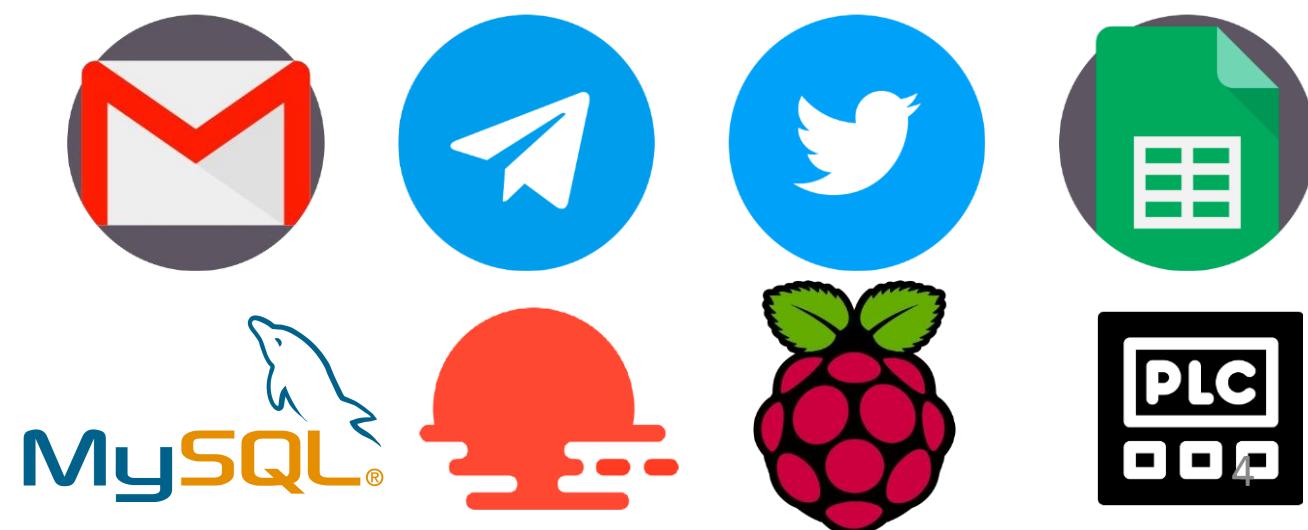

# Introduction to Node-RED

- Visual programming tool that can be accessed right from the web browser.
- Functional programming block called **nodes** are ready to use with less code or without having to program anything.
- Allow us to visually create automation system, system bot or even web scrapping.
- Able to interact with online services, such as Gmail, Telegram, Twitter, Google Sheet, OpenWeather, or even with the connected machine.

Programming  
& Integrations

## Who created Node-RED?

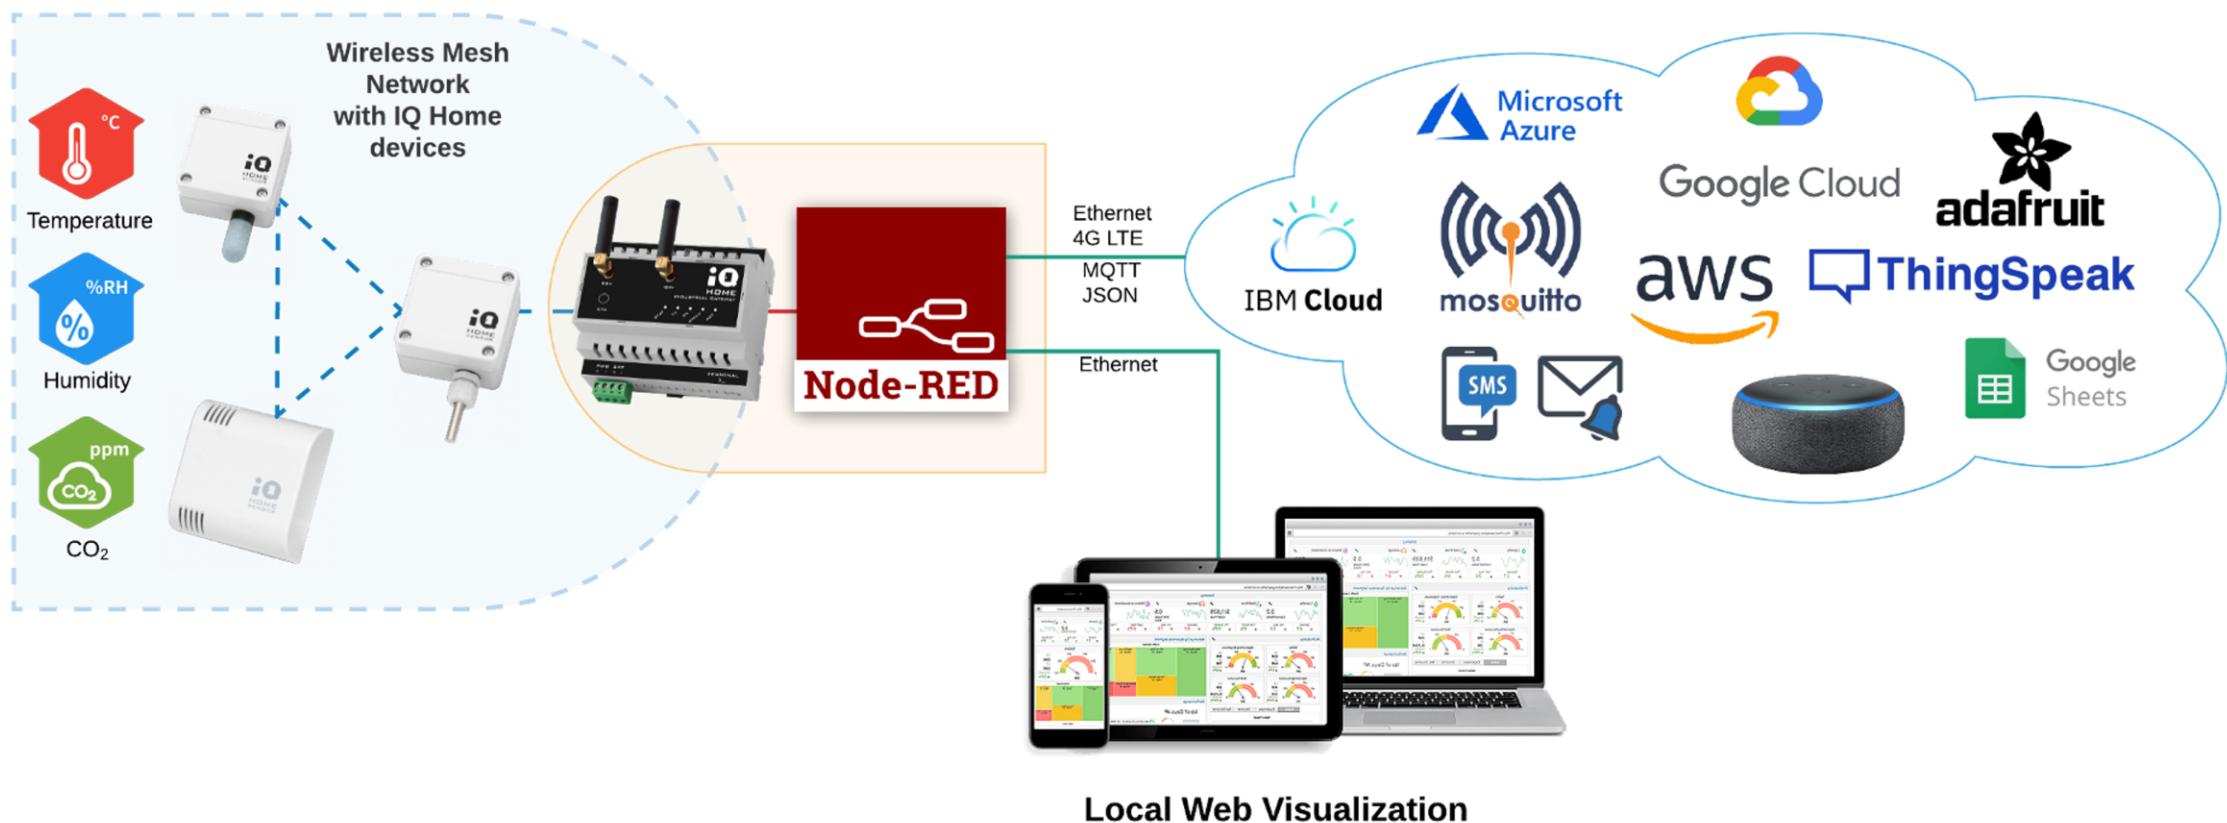

- Originally developed in 2013 by two IBM employees, Nick O'Leary and Dave Conway-Jones.
- They open sourced the source code which made available on GitHub  
<https://github.com/node-red/node-red>

What's new in  
Node-RED 3.0

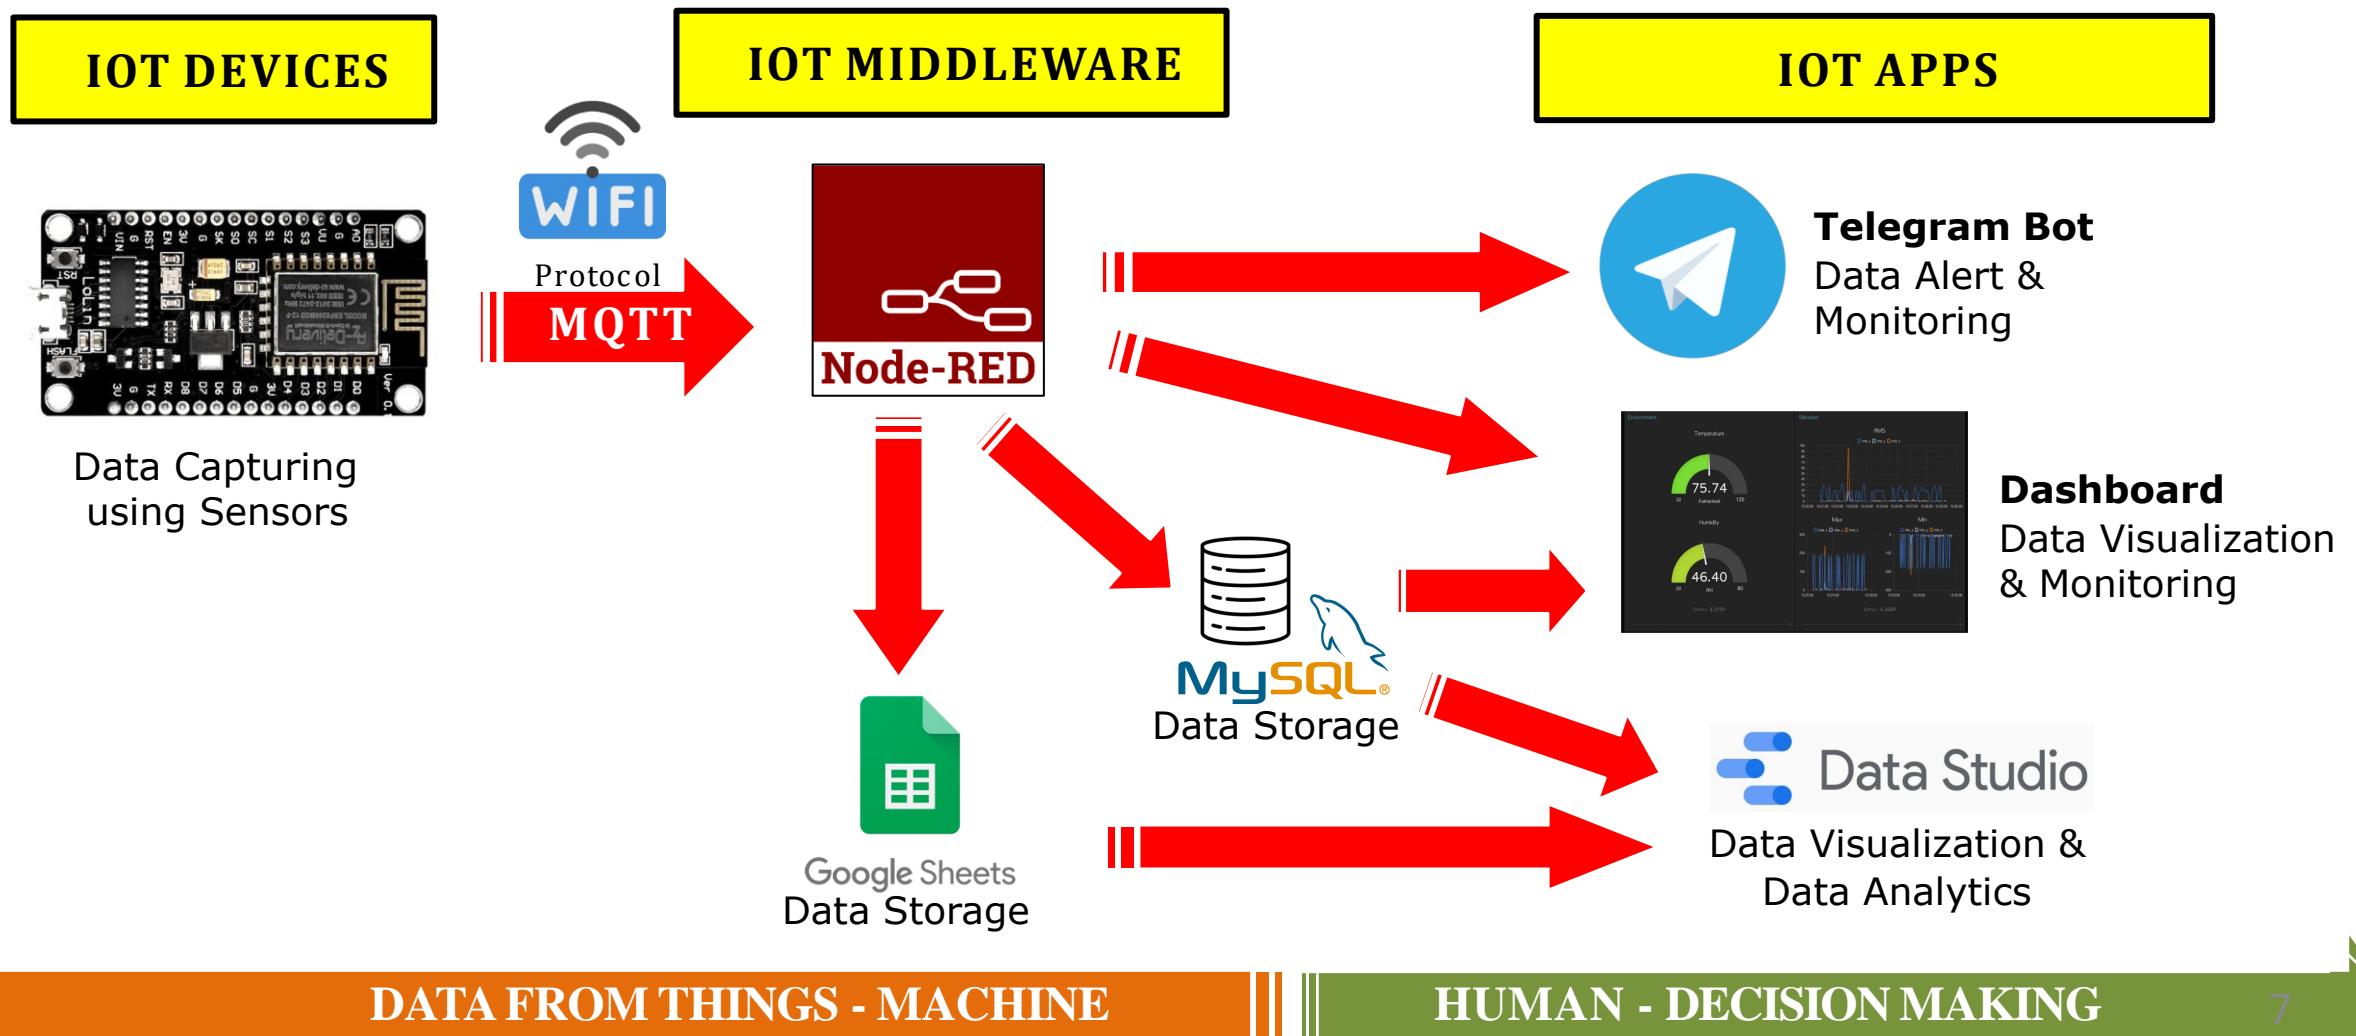

# Introduction to Node-RED

Node-RED is the IoT middleware between the physical world, where data is collected by the smart devices and provision the data to the cloud computing or Internet services.

# Introduction to Node-RED

Basic IoT architecture using Node-RED as the middleware.

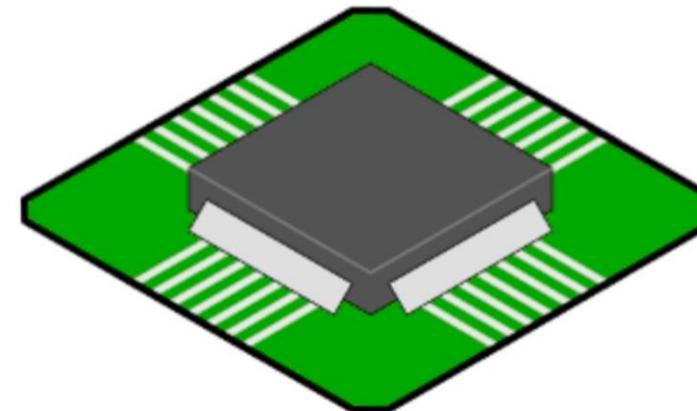

# Introduction to Node-RED

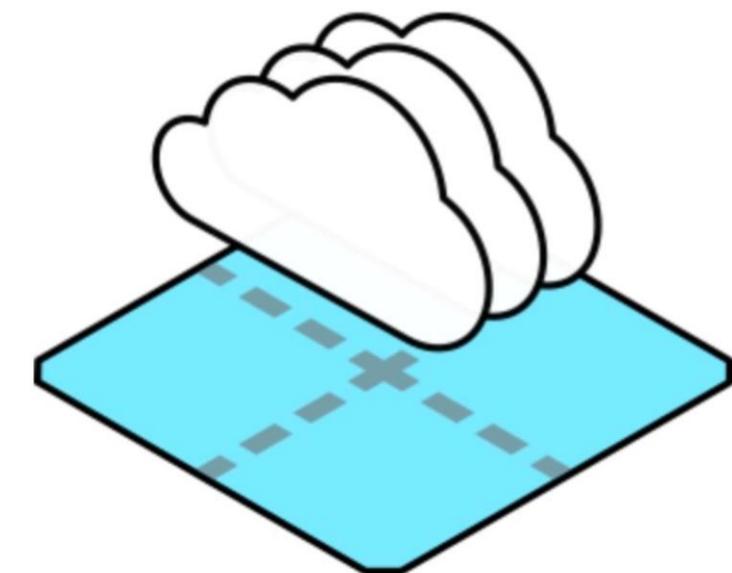

- Node-RED is a flexible middleware that can run on multi-cross platform such as:
  - Personal computer (PC running on Windows, Linux or Mac OS)
  - Local server or tiny computer (e.g. Raspberry Pi, Beagle Bone, Orange Pi)
  - Cloud computing services.

# Common Node-RED Nodes

Node	Description
	<p>The <b>Inject node</b> can be used to manually trigger a flow by clicking the node's button within the editor. It can also be used to automatically trigger flows at regular intervals.</p>
	<p>The <b>Debug node</b> is used to display messages which comes from the output of other node, which the messages can be seen by the debug tab, within the Node-RED sidebar.</p> <p>The button on the node can be used to enable or disable the output node. It is recommended to disable or remove any Debug nodes that are not being used.</p>
	<p>The <b>Function node</b> allows developers to write JavaScript code to be run on the node, against the messages that are passed through it.</p>

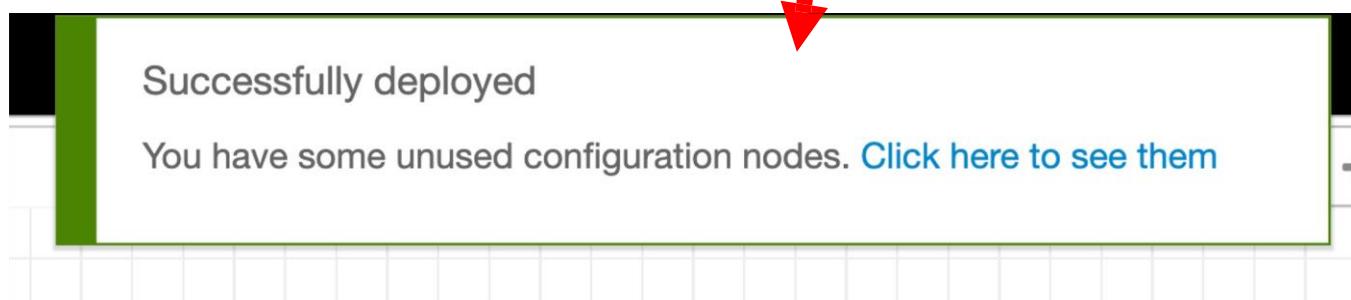

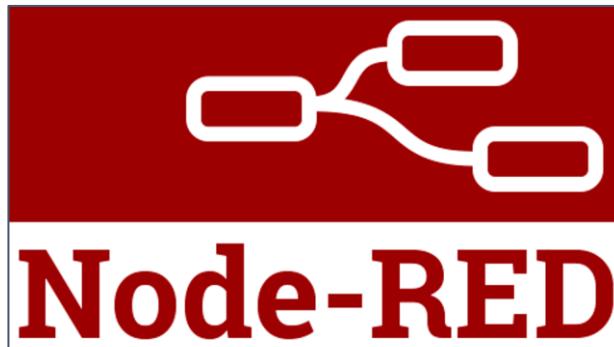

- Very important button to execute the Node-RED flow process function.
- Click for every flow or nodes changes.

Deployed notification

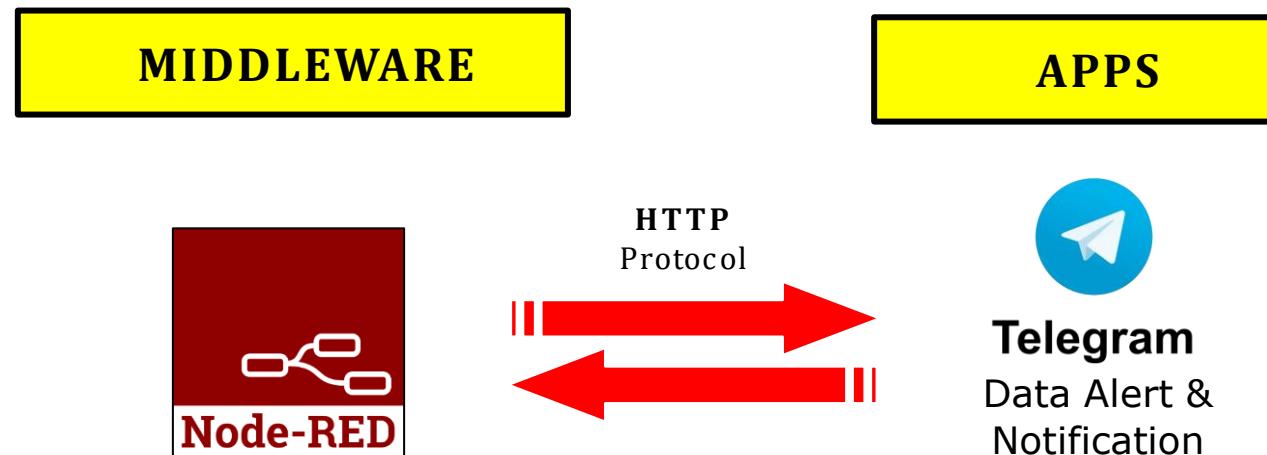

# Node-RED & Telegram

Integrating visual based programming with the most popular messaging  
platform in the world

# Introduction to Node-RED

The architecture:

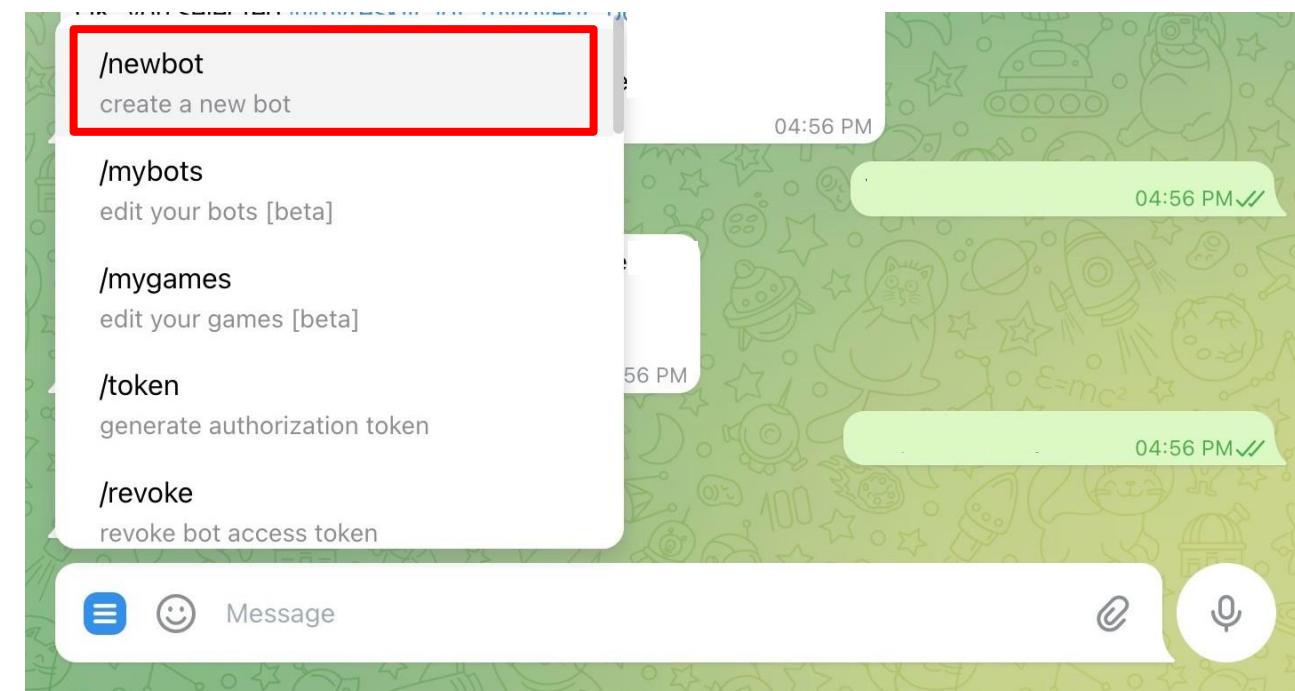

## Let's Create a Telegram Bot (4 Steps)

1. In Telegram, search for botfather or go to <https://t.me/BotFather>

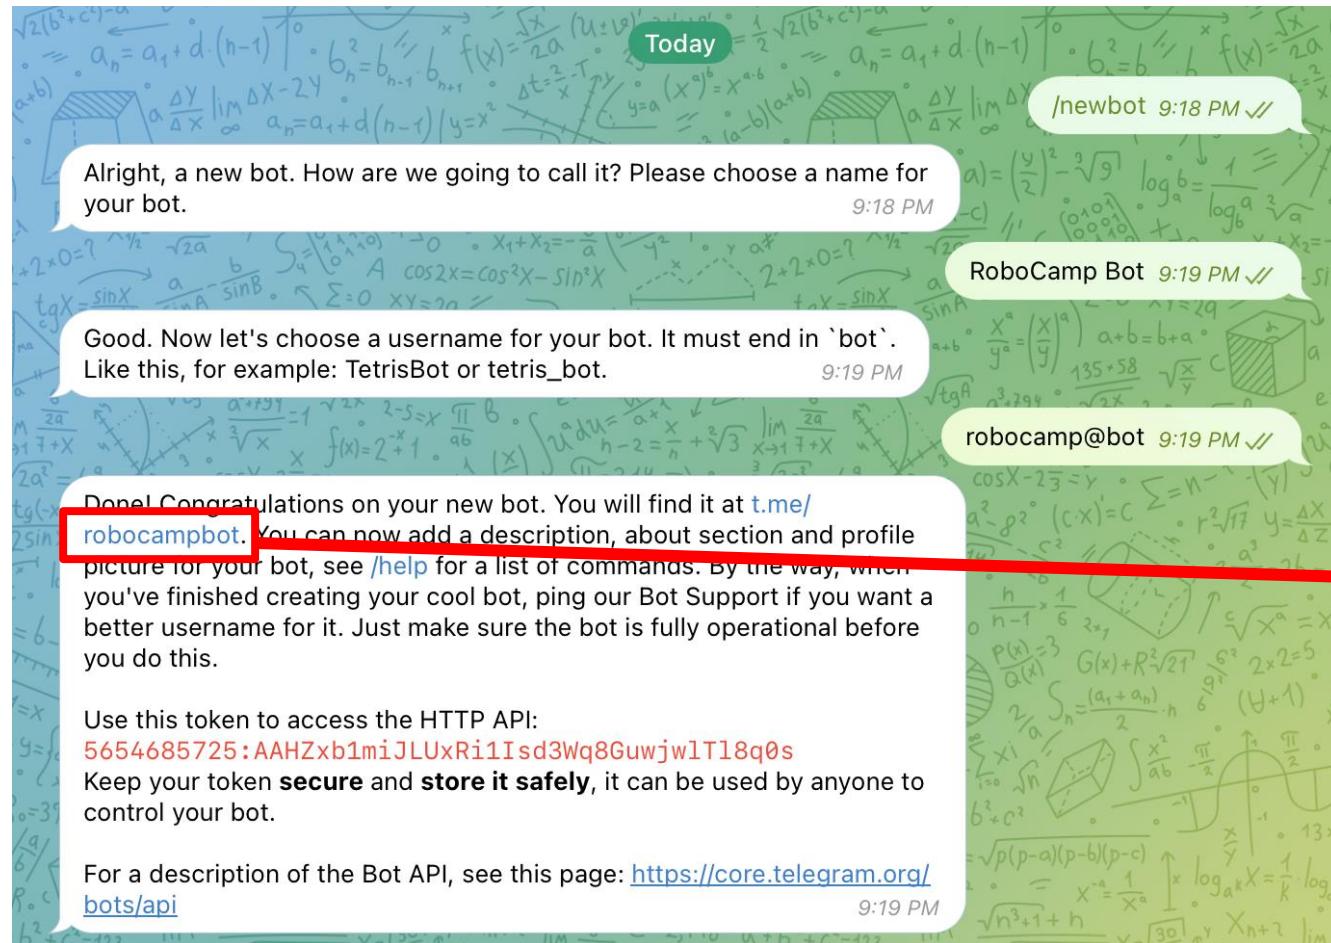

2. Click on the chat menu and click **/newbot** to create new bot.

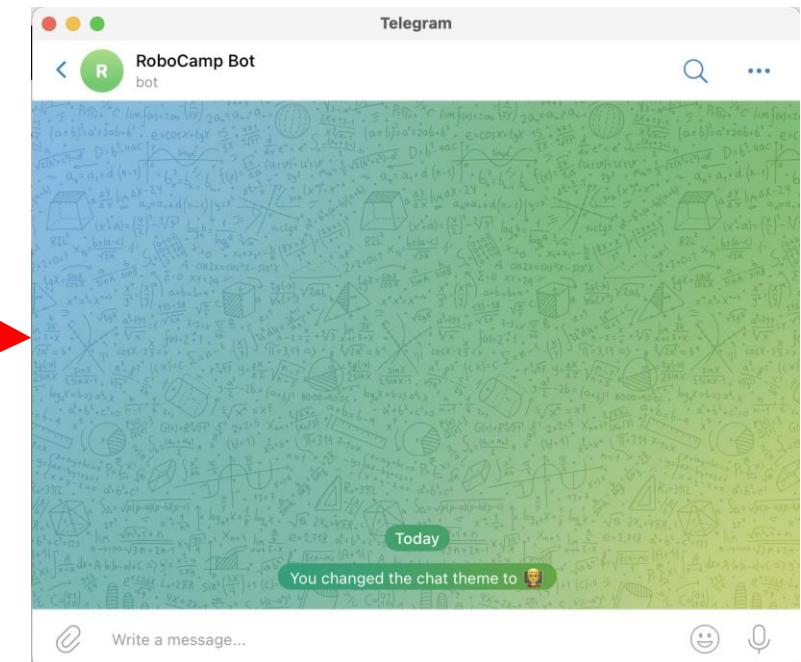

# Node-RED with Telegram Bot

3. Follow the instruction to create bot's name and bot's username as below conversation.

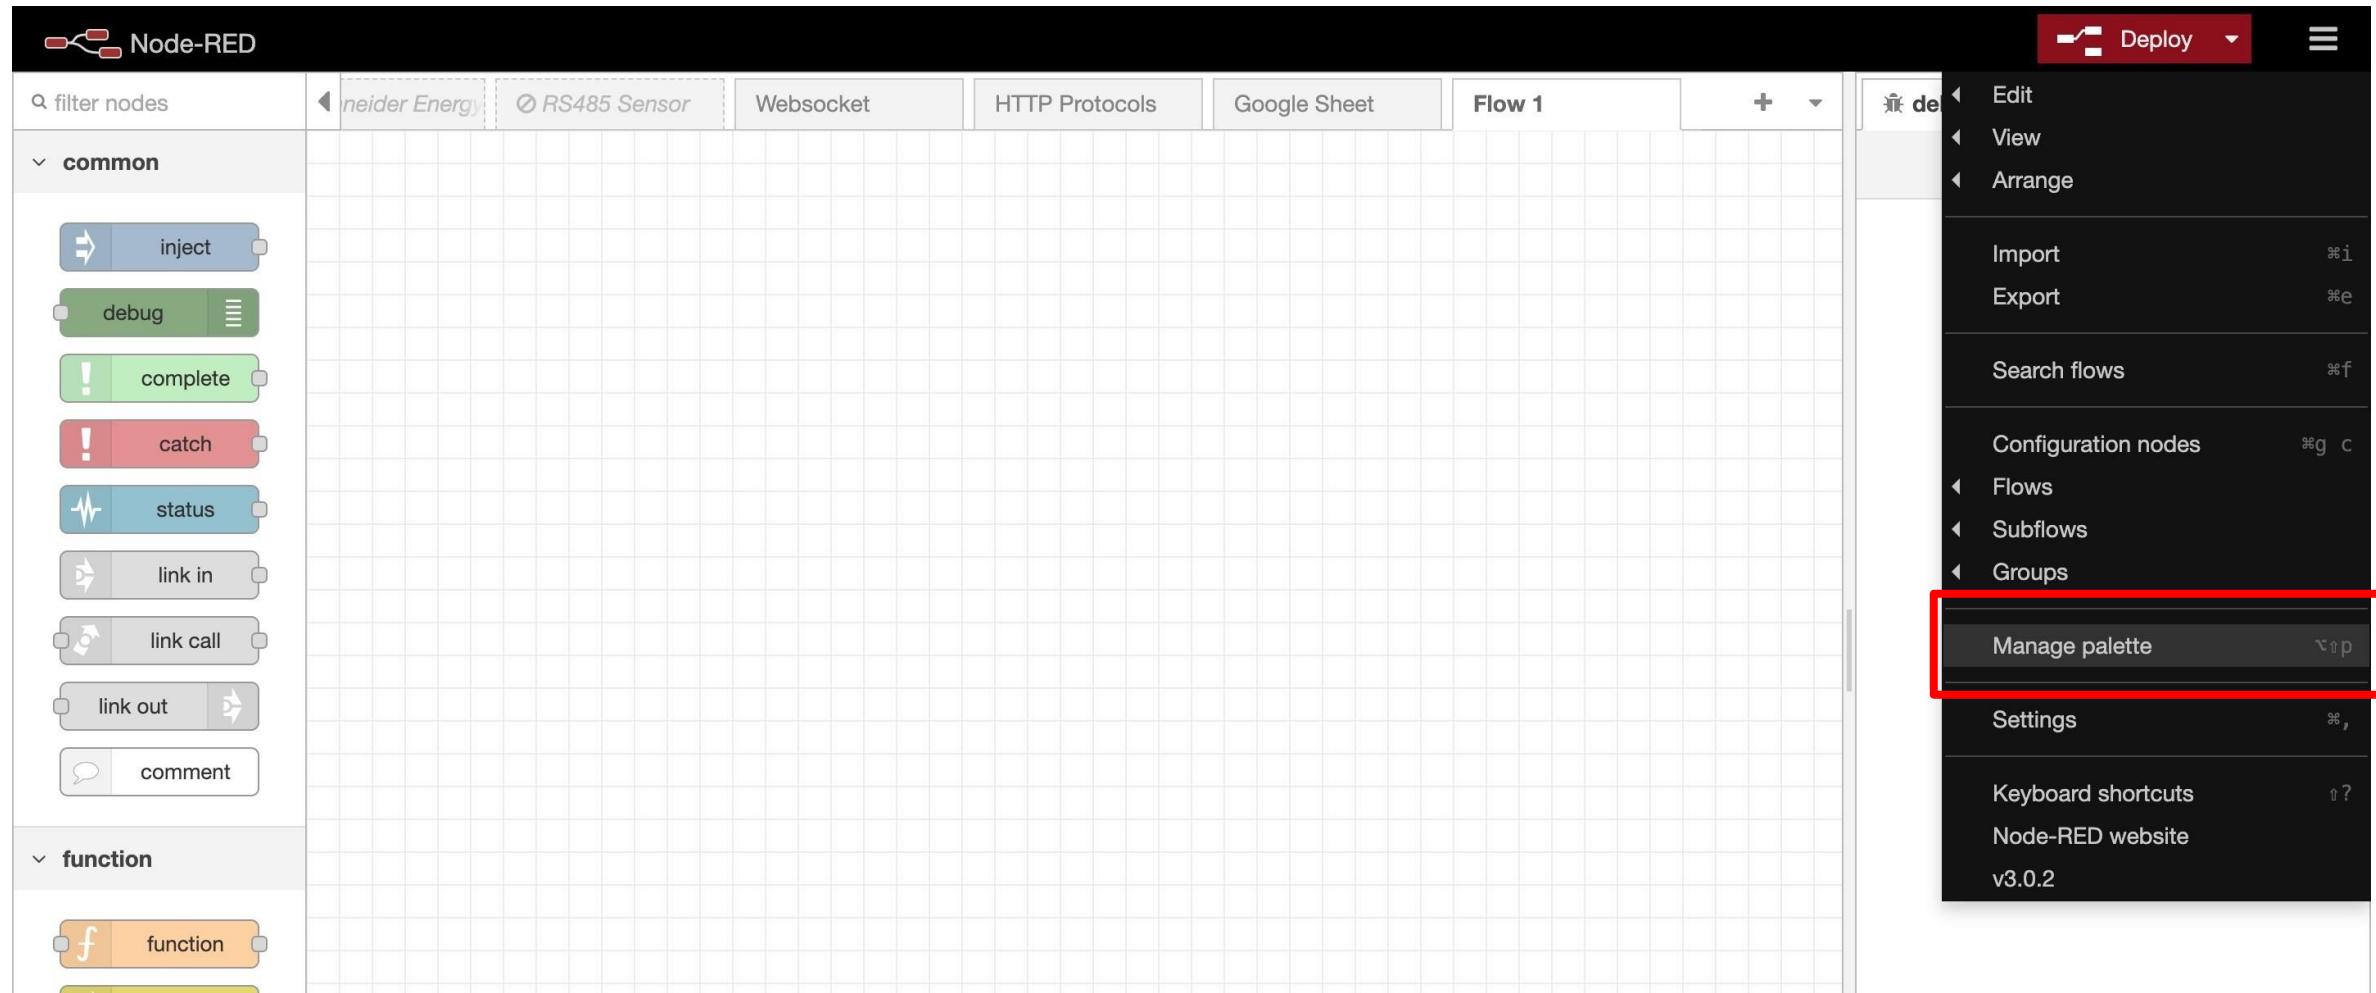

4. Click on the created bot's link and the bot is now accessible. Let's connect with Node-RED.

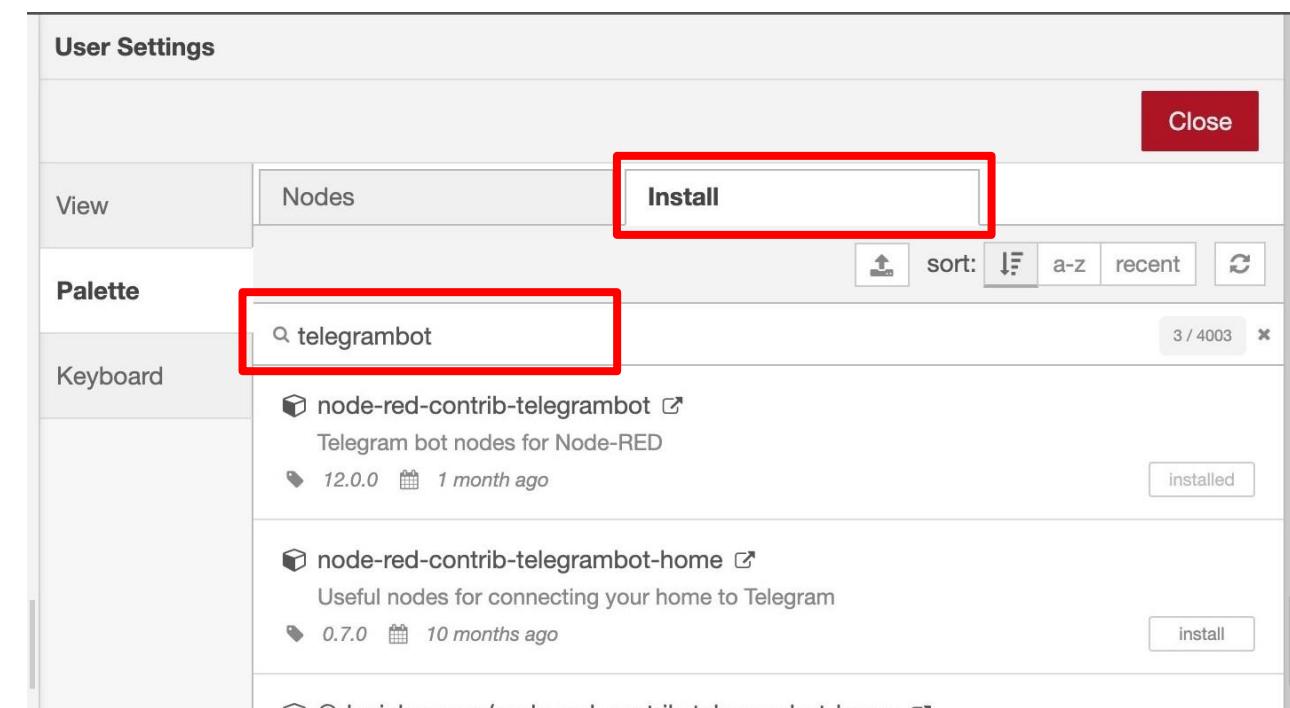

# Node-RED with Telegram Bot

- Click on the Node-RED's menu, and click **Manage palette**

- Click on the **Install** tab and on the **search modules** fields type **telegrambot** to filter the list of the available modules.
- Click the **install** button to install the **node-red-contrib-telegrambot** module and wait until the installation process is successful.

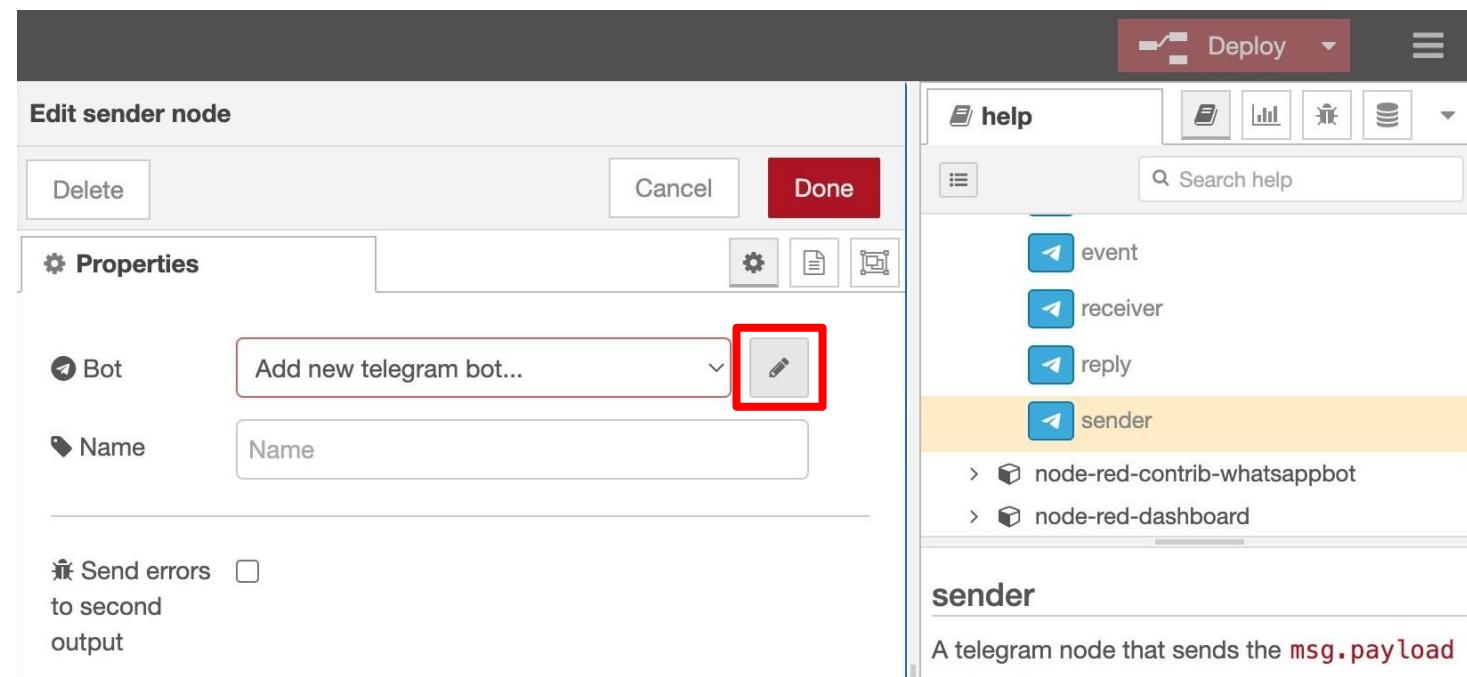

- Once the installation is successful, the telegram nodes is available on the palette under category: **telegram**. The nodes includes *receiver*, *command*, *event*, *sender* and *reply*.

## Let's Get Bot's Chat ID (12 Steps)

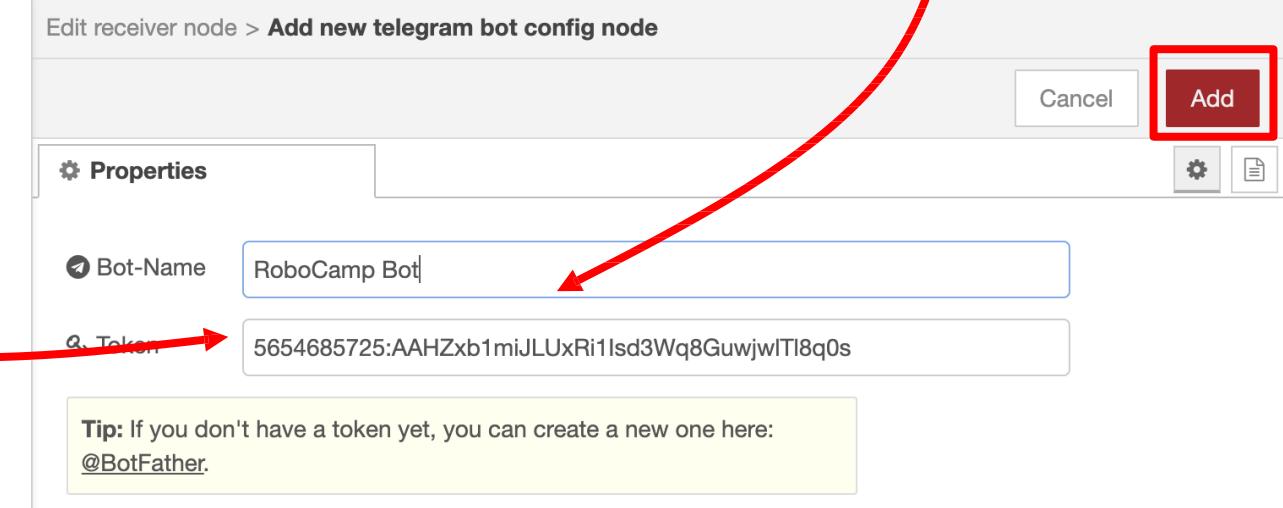

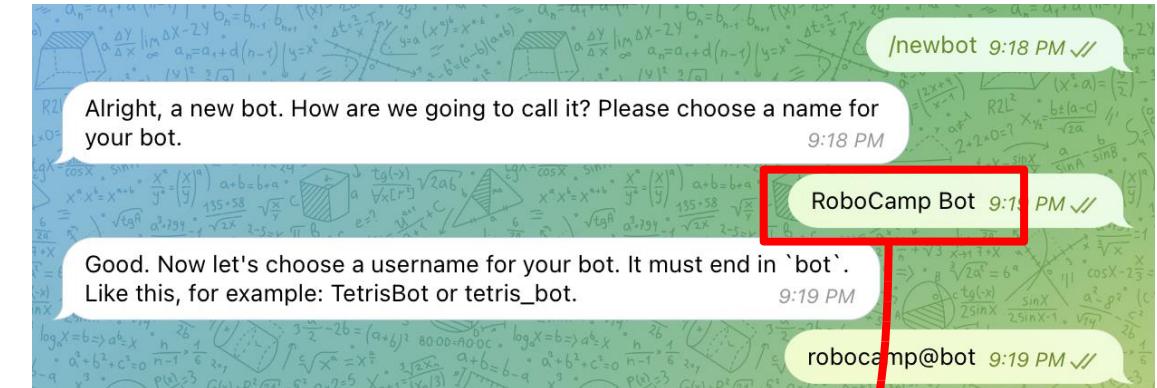

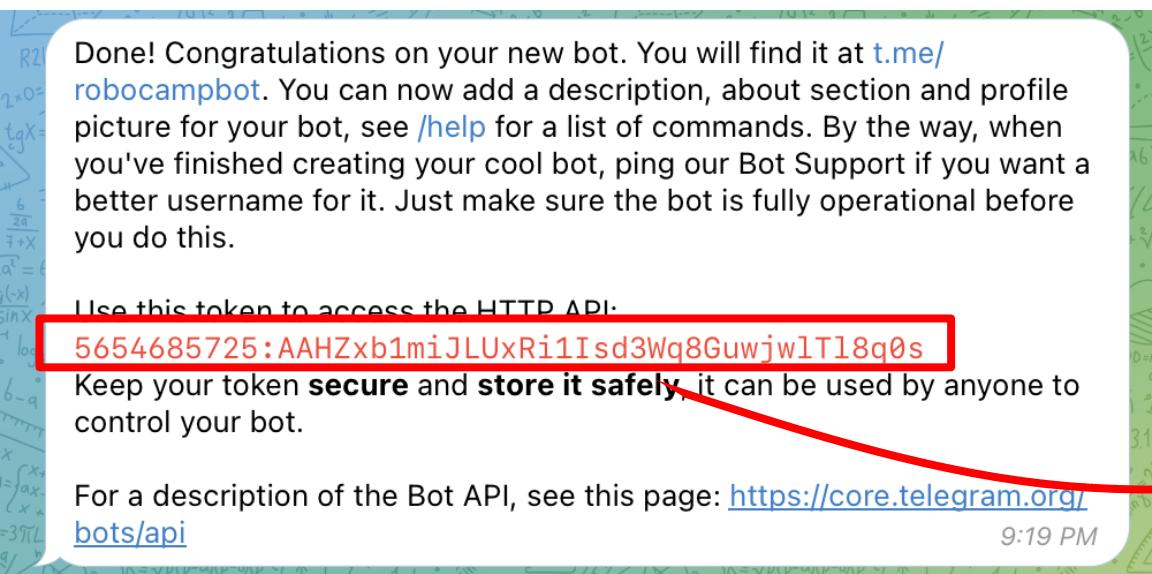

1. Insert **receiver** telegram node into the workspace.
2. Double click the node to edit the Properties.
3. Click **pencil icon** to Add new telegram bot...

## 4. Insert Bot-Name

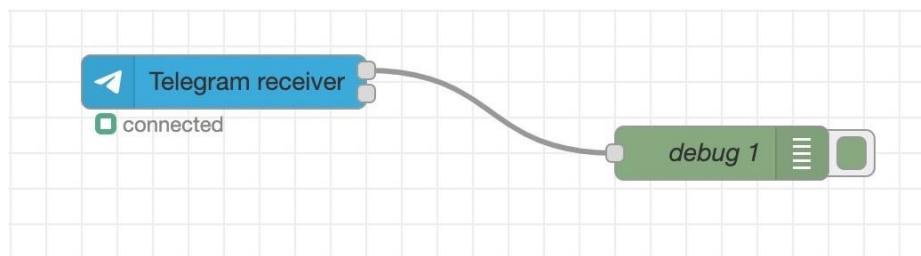

## 5. Insert Token

## 6. Click the Add button.

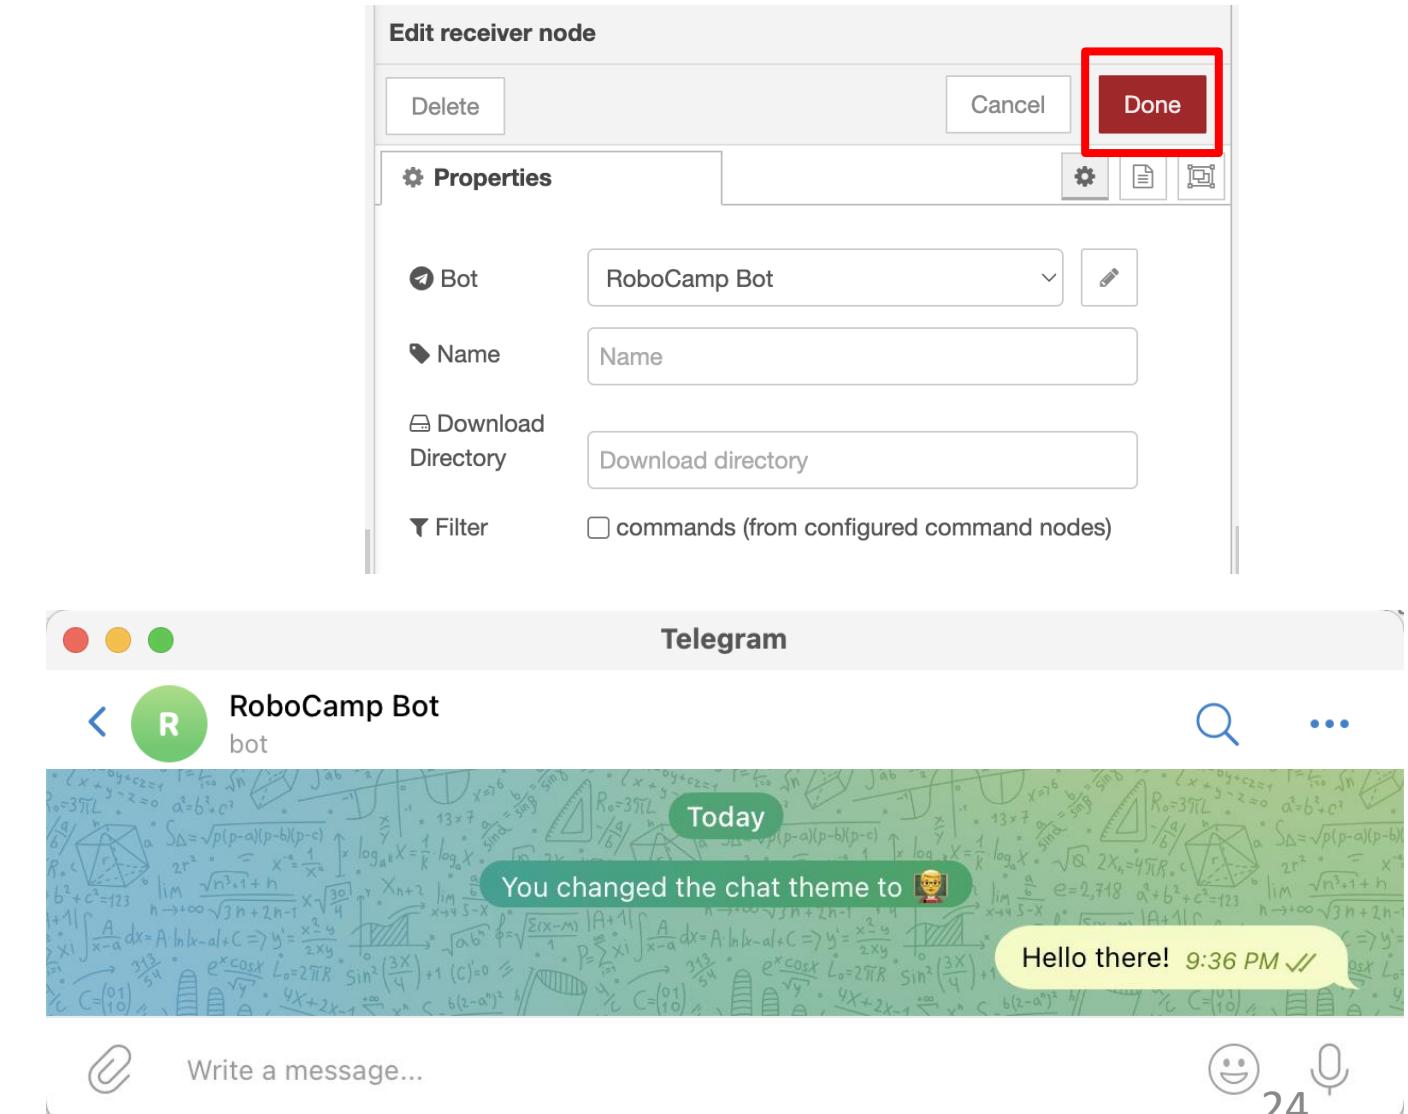

# Node-RED with Telegram Bot

7. The **Bot** information is ready.
8. Click the **Done** button.
9. Click the Node-RED's **Deploy** button.

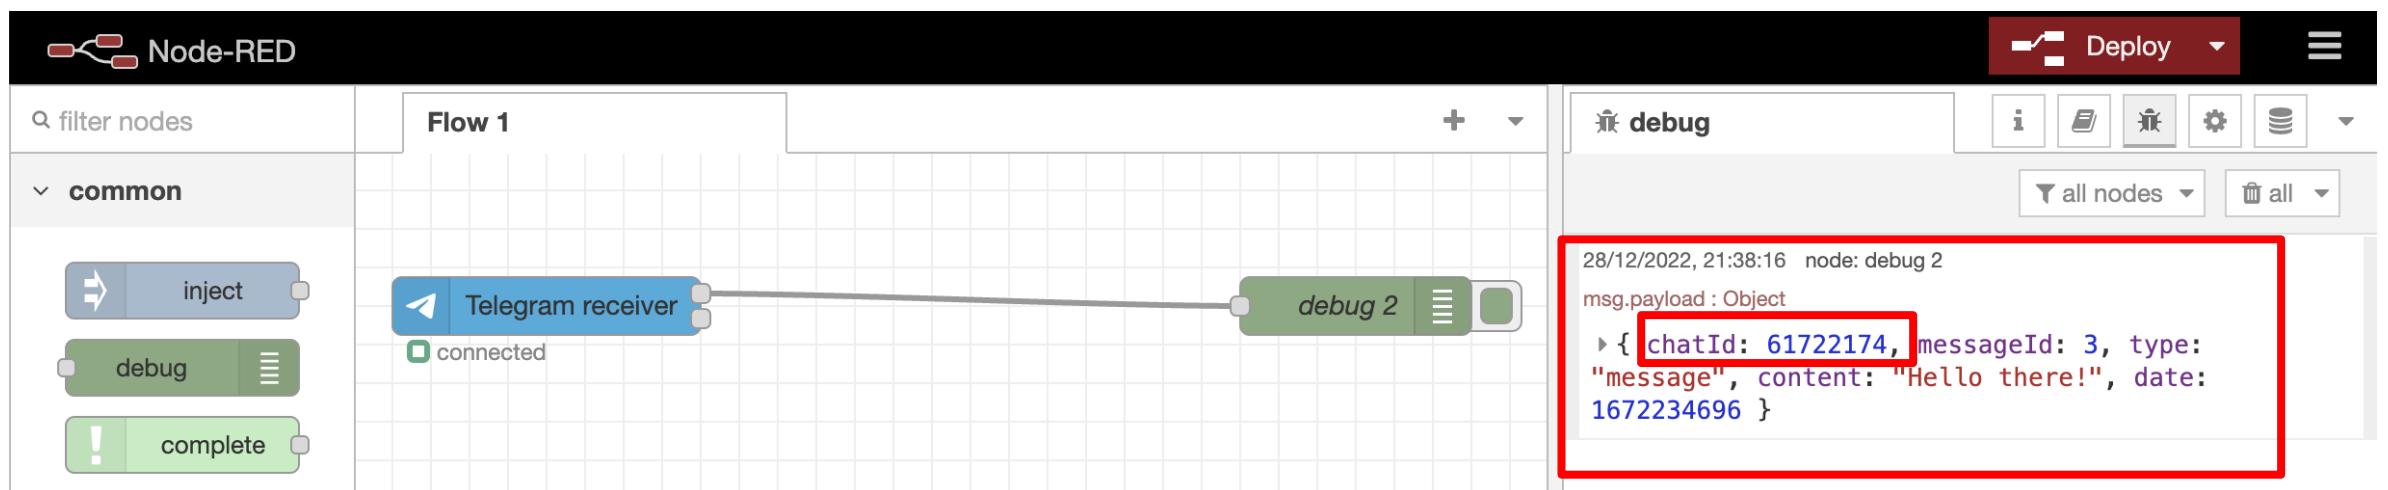

10. Go to Bot chat box and send some message.

The top half of the image shows the 'Edit receiver node' dialog. It has tabs for 'Properties' and 'Commands'. Under 'Properties', there is a section for 'Bot' which is set to 'RoboCamp Bot'. There are also fields for 'Name', 'Download Directory', and a 'Filter' checkbox. A red box highlights the 'Done' button in the top right corner of the dialog.

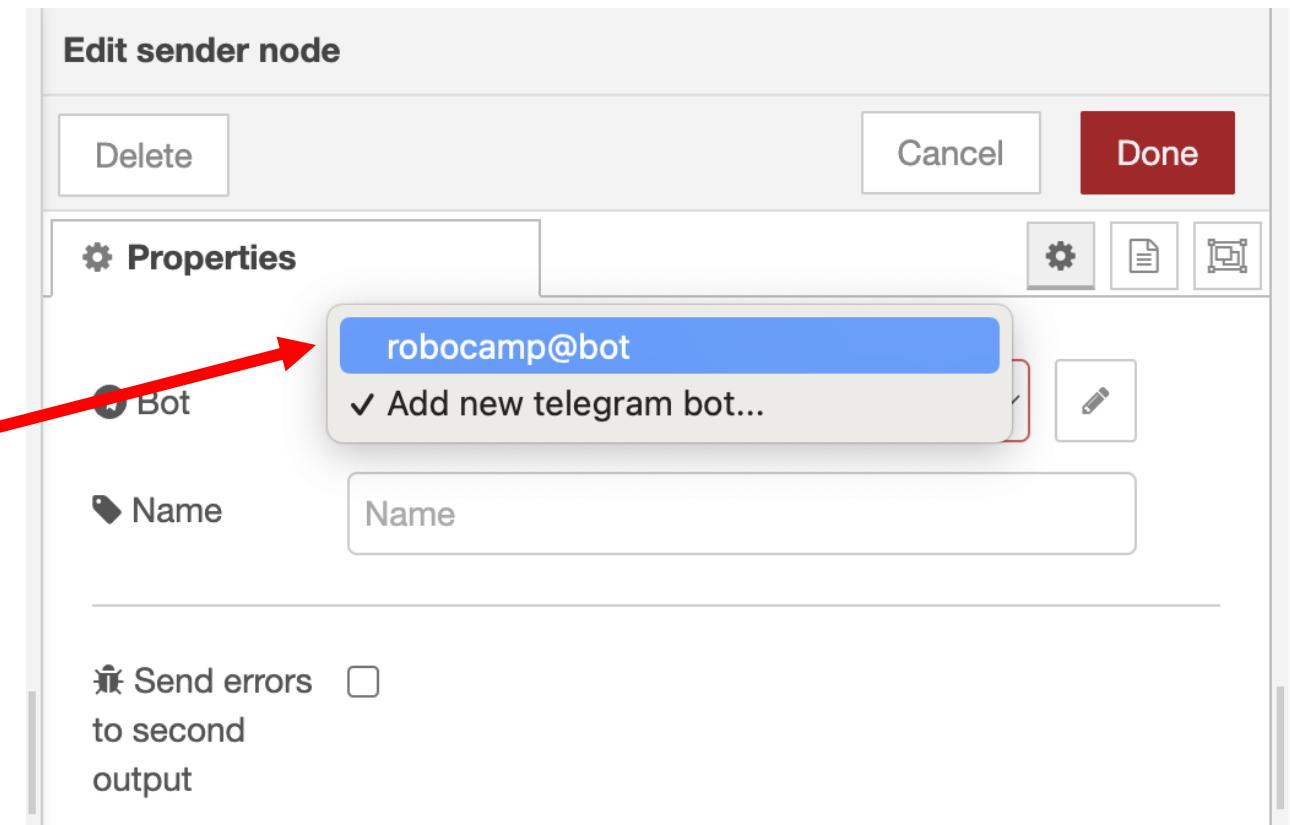

The bottom half of the image shows a screenshot of a Telegram chat window. The title of the chat is 'RoboCamp Bot'. The message history includes a message from the bot stating 'You changed the chat theme to 🧑' and a message from the user 'Hello there! 9:36 PM //'. At the bottom of the screen, there is a text input field with the placeholder 'Write a message...' and a smiley face icon.

11. Observe the Debug tab output on the Node-RED's sidebar.
12. The Bot's Chat ID is the value of **chatId** key as available on the **msg.payload** object.

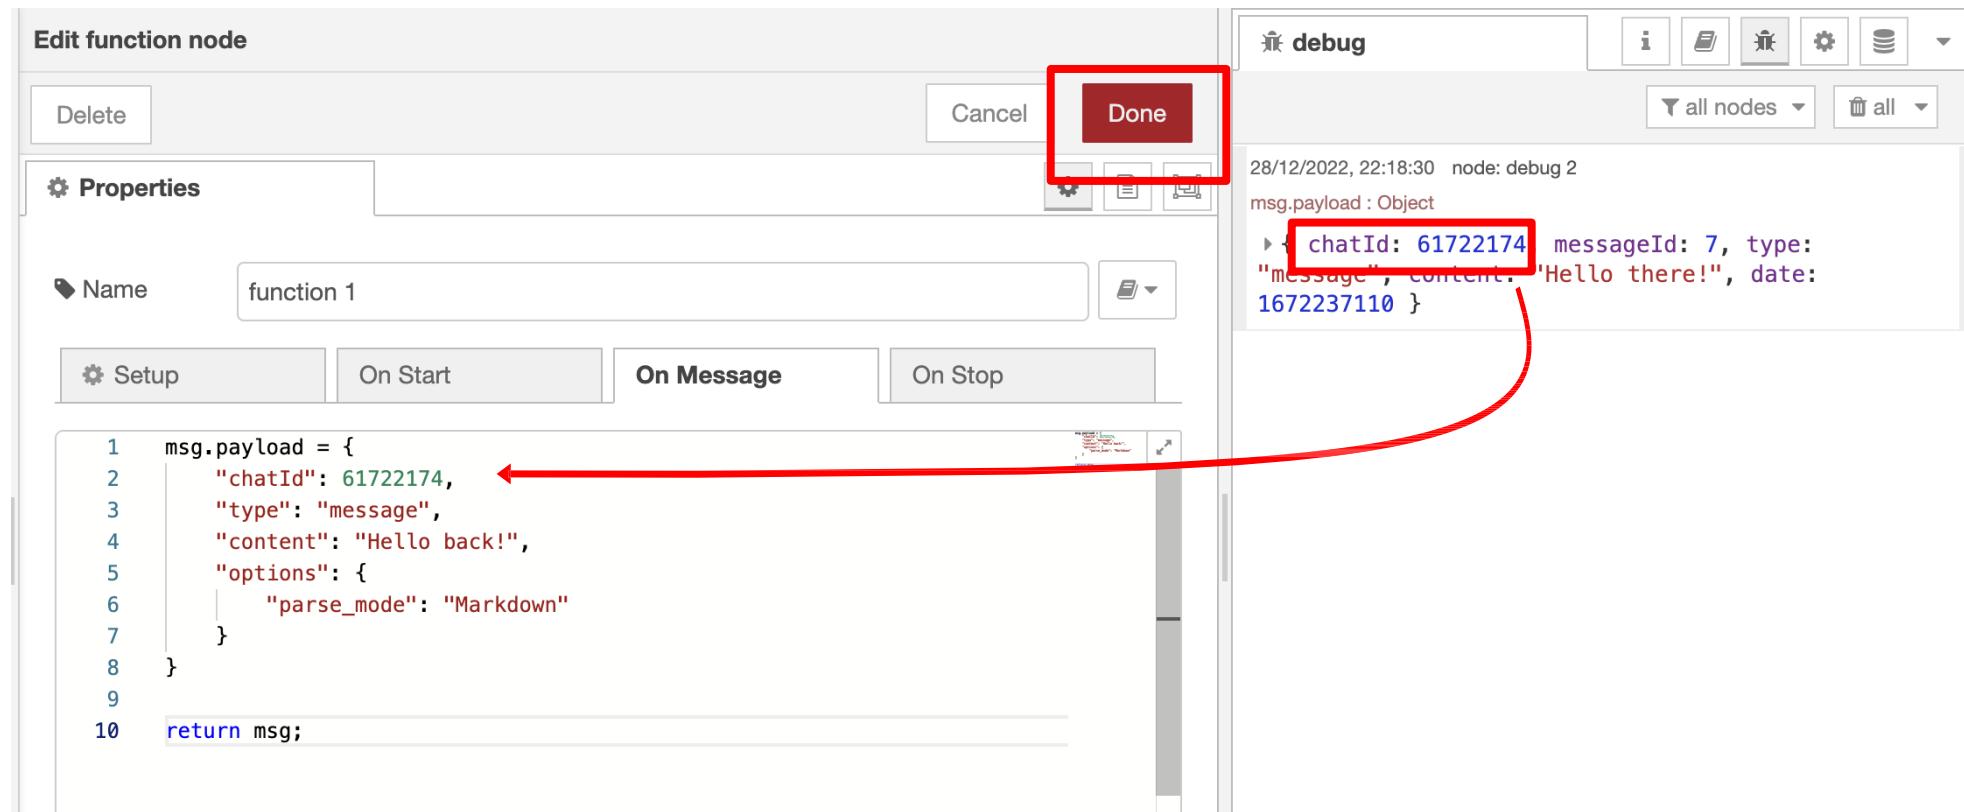

## Send Automated Message to the Telegram Bot (7 Steps)

1. Insert **Inject** node, **Function** node and Telegram **sender** node into the workspace.
2. Edit the Telegram **sender** node Bot's properties, select your existing Bot that had been setup before.

3. Open the **Function** node to add Telegram's chat information as in the image below.

The screenshot shows the Node-RED interface with two main panels:

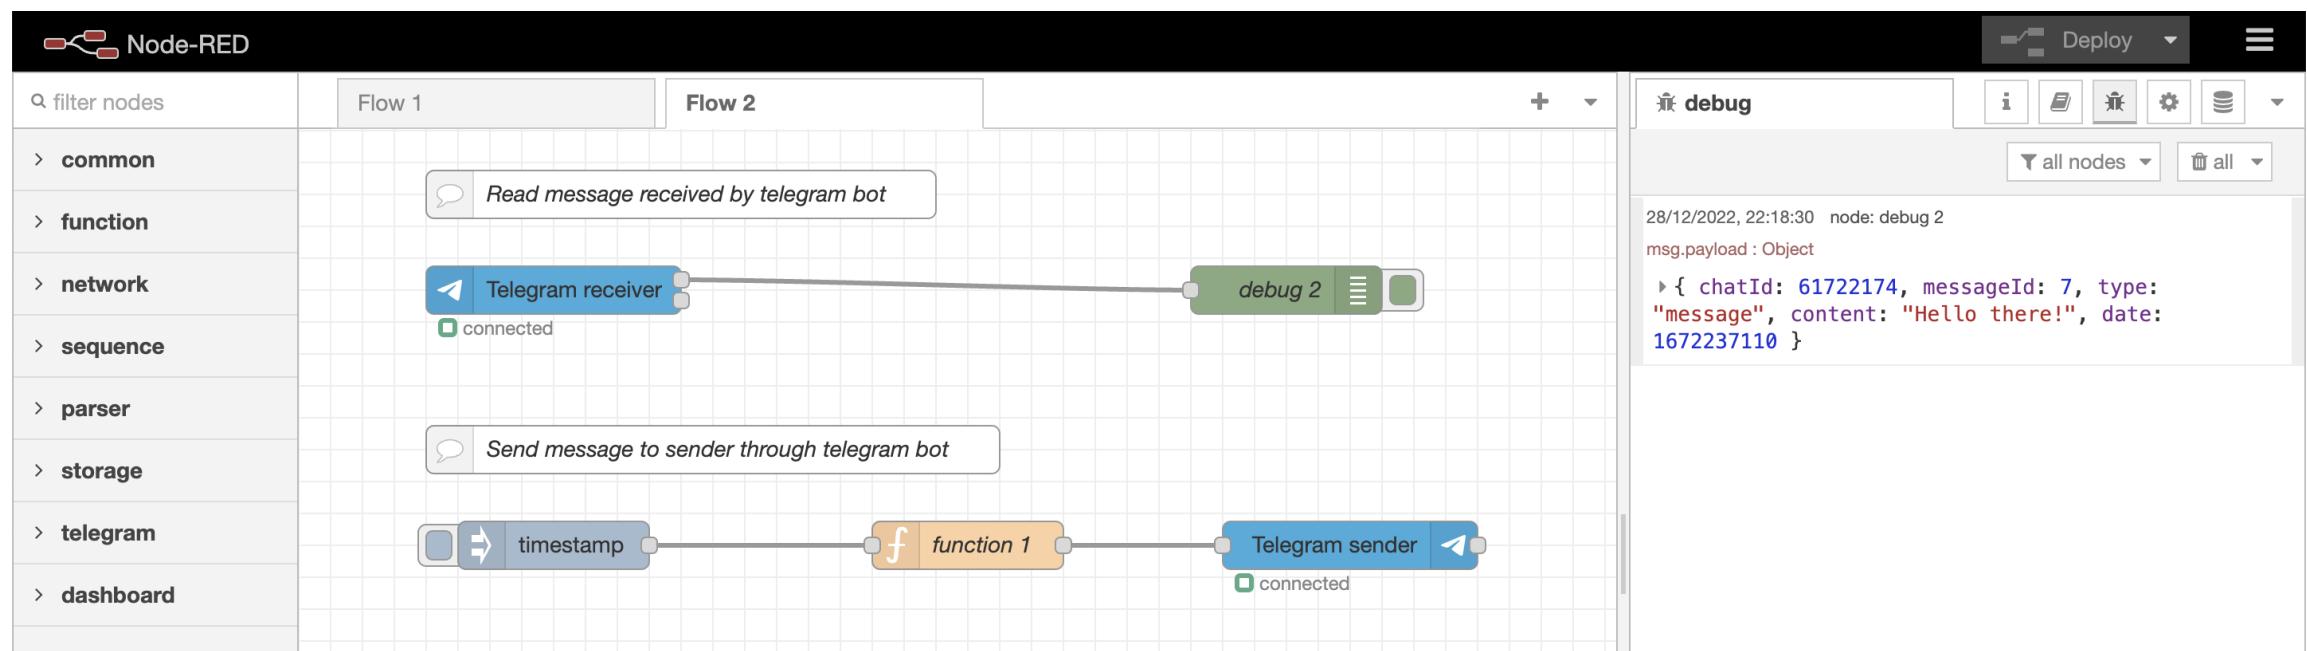

- Edit function node** (Left Panel):
  - Properties** tab is selected.
  - Name**: function 1
  - On Message** tab is selected.
  - Code Area** (highlighted by a red arrow):
 

```

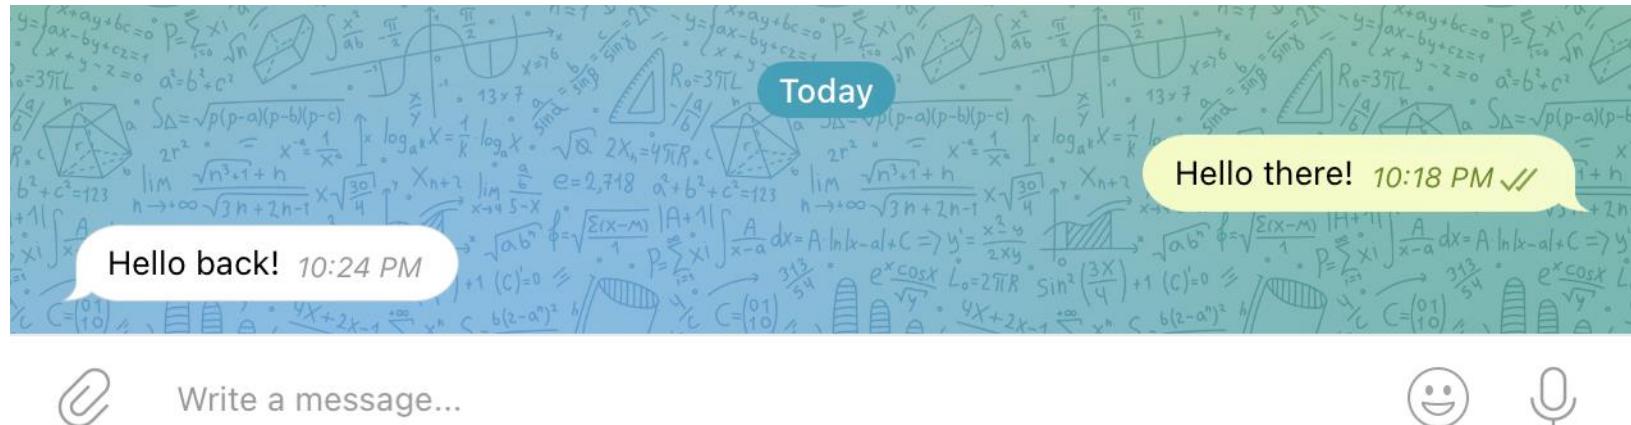

1 msg.payload = {
2   "chatId": 61722174,
3   "type": "message",
4   "content": "Hello back!",
5   "options": {
6     "parse_mode": "Markdown"
7   }
8 }
9
10 return msg;

```
- debug** (Right Panel):
  - Shows a log entry from 28/12/2022, 22:18:30: node: debug 2
  - msg.payload : Object
  - chatId: 61722174 messageId: 7 type: "message", content: "Hello there!", date: 1672237110

4. Connect the nodes.
5. Click the Node-RED's **Deploy** button.
6. Click the **Inject** node button to send the message of **Assalamualaikum** to the Bot.

7. Check the Telegram, the Bot has received the message from Node-RED.

8. Change the Inject node **Repeat** properties to automatically send the message by interval time or specific time.

Inject once after  seconds, then

**C Repeat**

at a specific time

at

on  Monday  Tuesday  Wednesday  
 Thursday  Friday  Saturday  
 Sunday

Inject once after  seconds, then

**C Repeat**

at a specific time

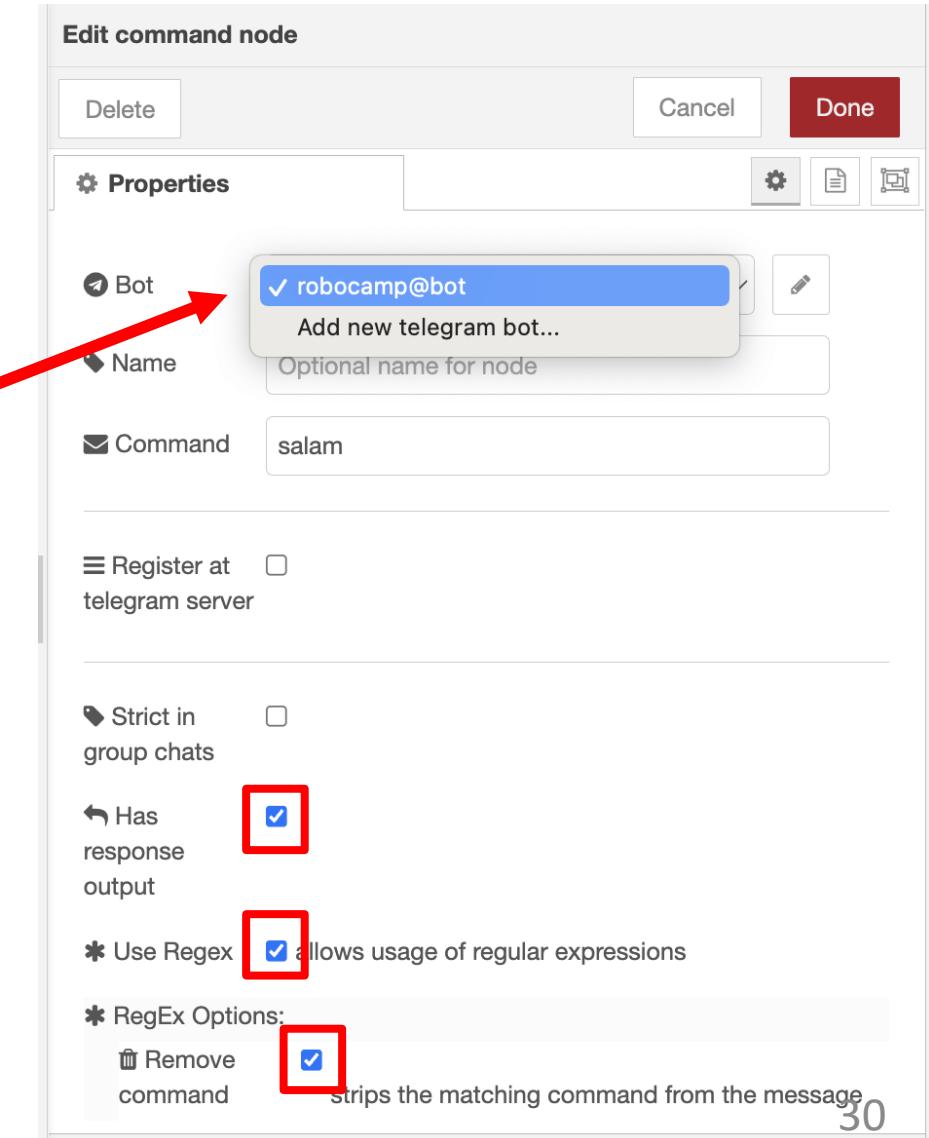

at

on  Monday  Tuesday  Wednesday  
 Thursday  Friday  Saturday  
 Sunday

## Automated Reply Message to the Telegram Bot (8 Steps)

1. Insert telegram **command** node and **Function** node into the workspace.
2. Edit the Telegram **sender** node Bot's properties, select your existing Bot that had been setup before.
3. Command is **salam**.
4. Enable these options:
  - Has response output
  - Allows usage of regular expressions
  - Strips the matching command from the message

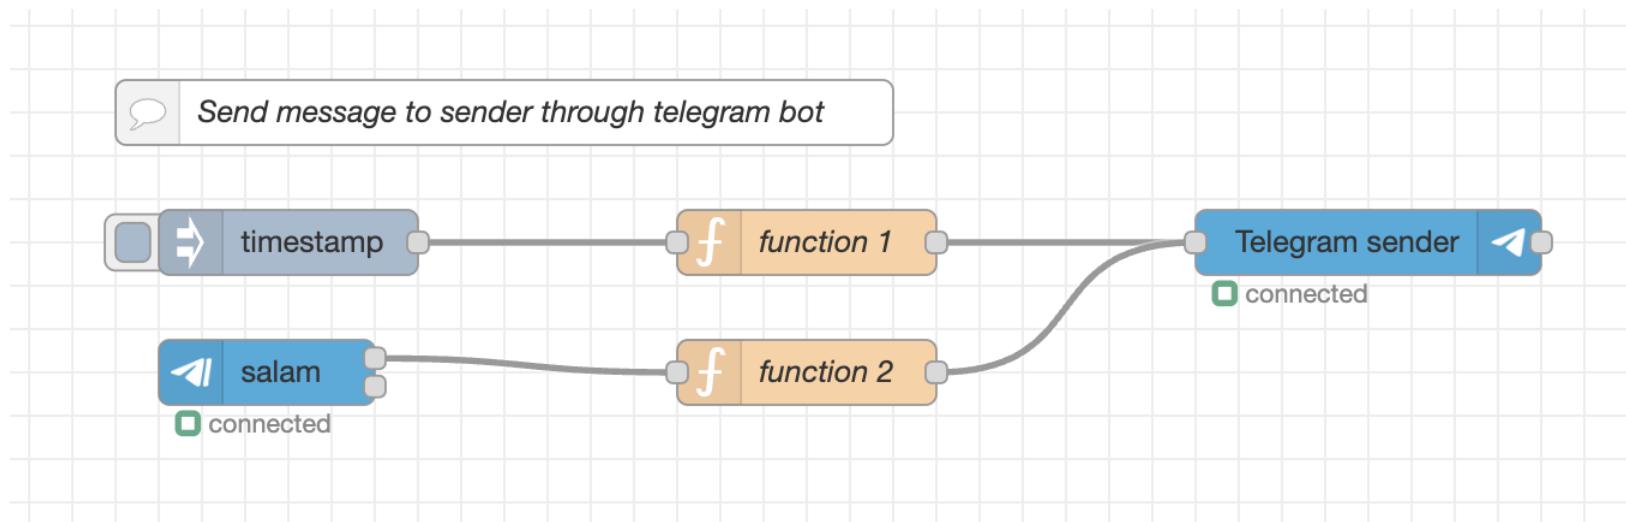

5. Open the **Function** node to add the code below in the **On Message** tab. Click Done.

Setup      On Start      **On Message**      On Stop

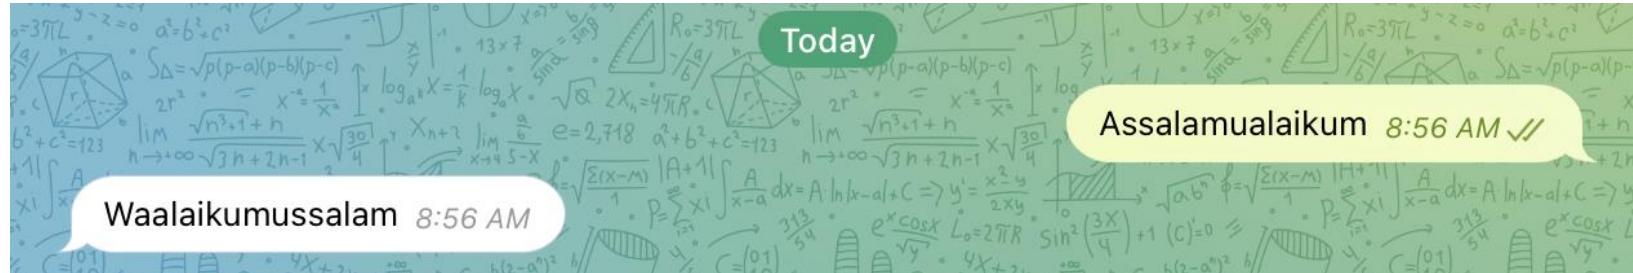

```
1 var chat_id = msg.payload.chatId;
2
3 msg.payload = {
4     "chatId": chat_id,
5     "type": "message",
6     "content": "Waalaikumussalam",
7     "options": {
8         "parse_mode": "Markdown"
9     }
10 }
11
12 return msg;
```

6. Connect the **command (salam)** node to **function** node. Connect **function** node to the previous **sender** node.

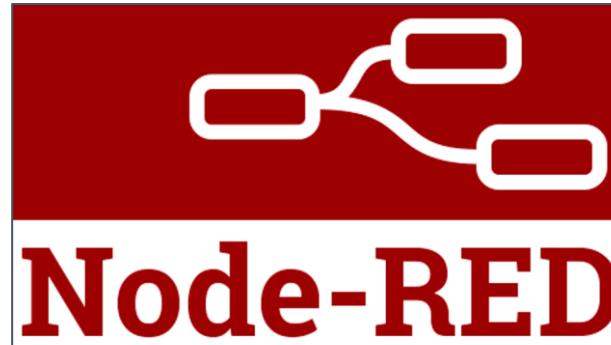

7. Click the Node-RED's Deploy button.

8. Open the Telegram, send “Assalamualaikum” message, the Bot should reply “Waalaikumussalam” automatically.

## Note:

The command node will look for any message containing the command word “salam”. If it finds any, function node will send “Waalaikumussalam” text to the sender **ChatId**. Sender ChatId is obtained from **msg.payload.chatId** received by the command node.

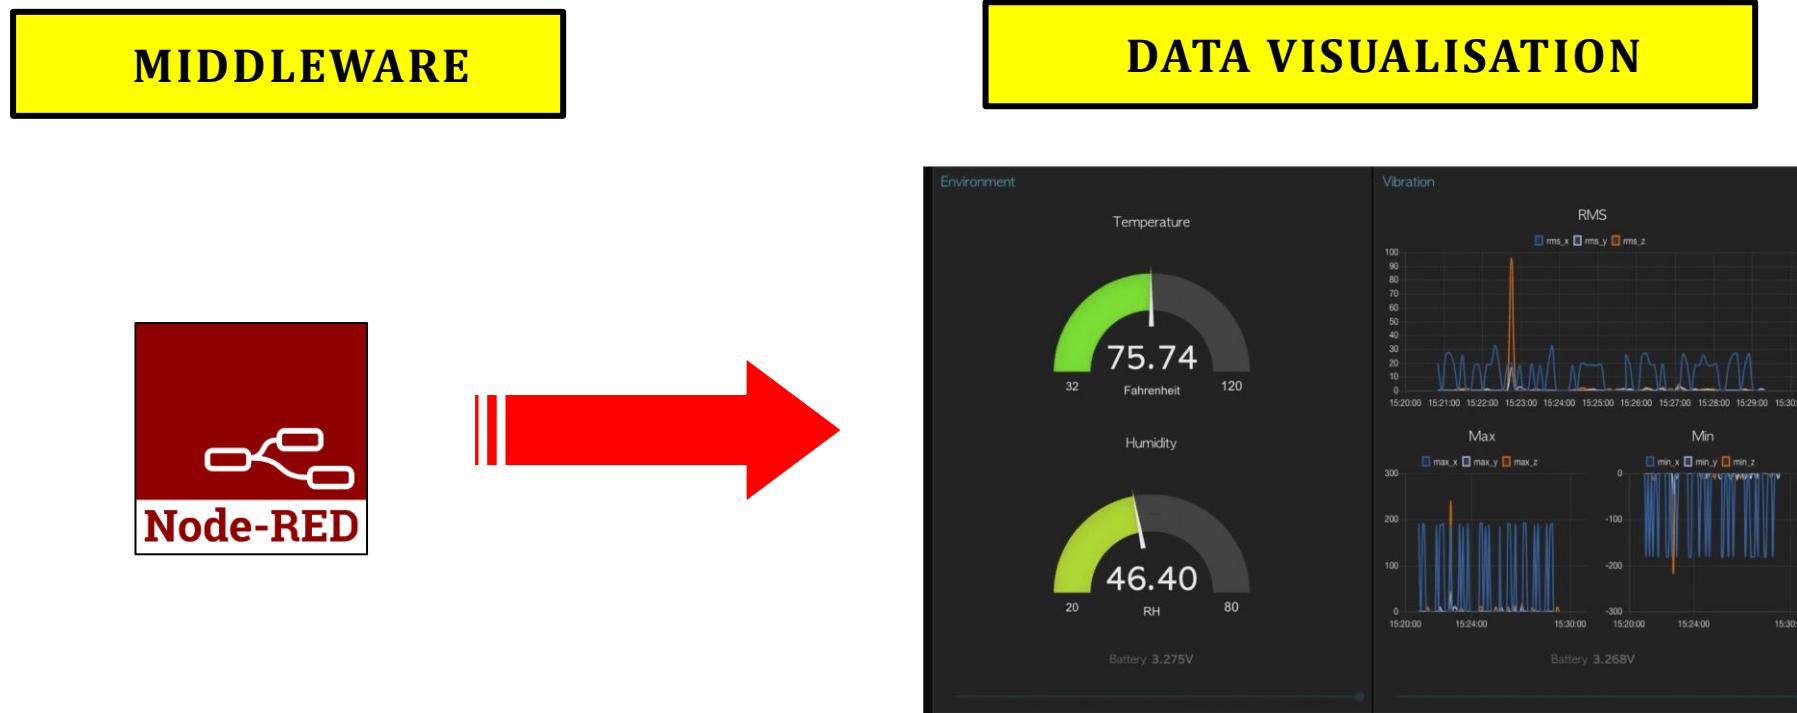

# Node-RED Dashboard

Set of nodes in Node-RED to quickly create a live data dashboard.

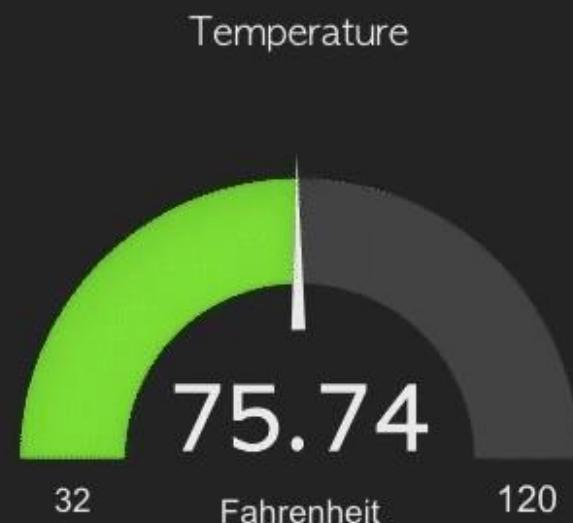

It provides nodes to quickly create a UI (user interface) with buttons, text input, sliders, charts, gauges, etc.

# Introduction to Node-RED

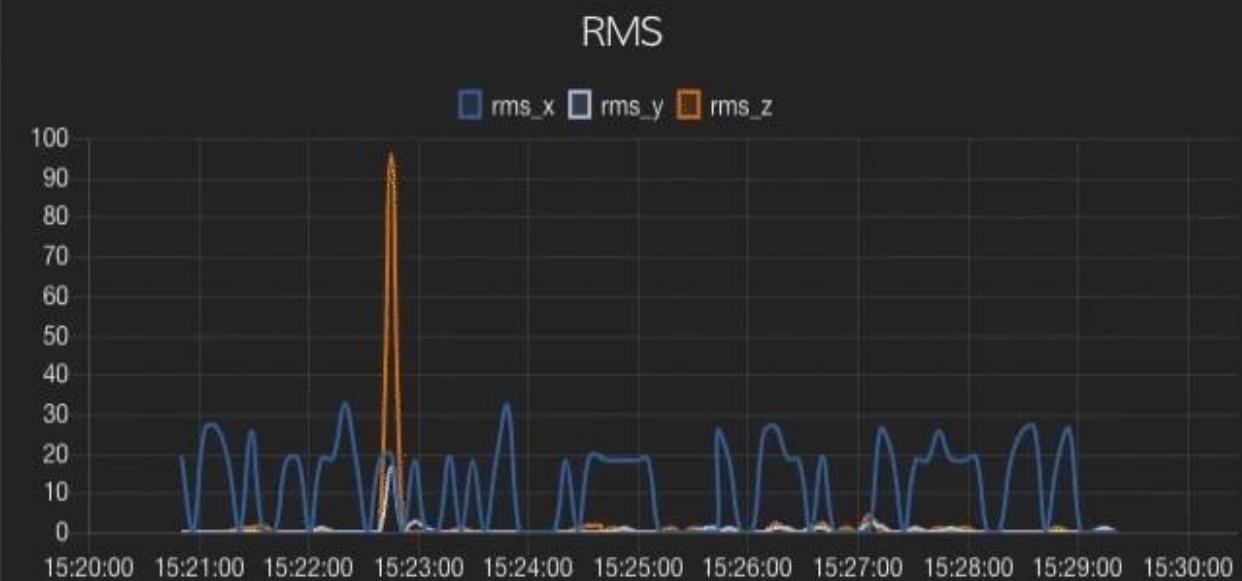

The architecture:

Data Visualization (Dashboard)  
Data Monitoring

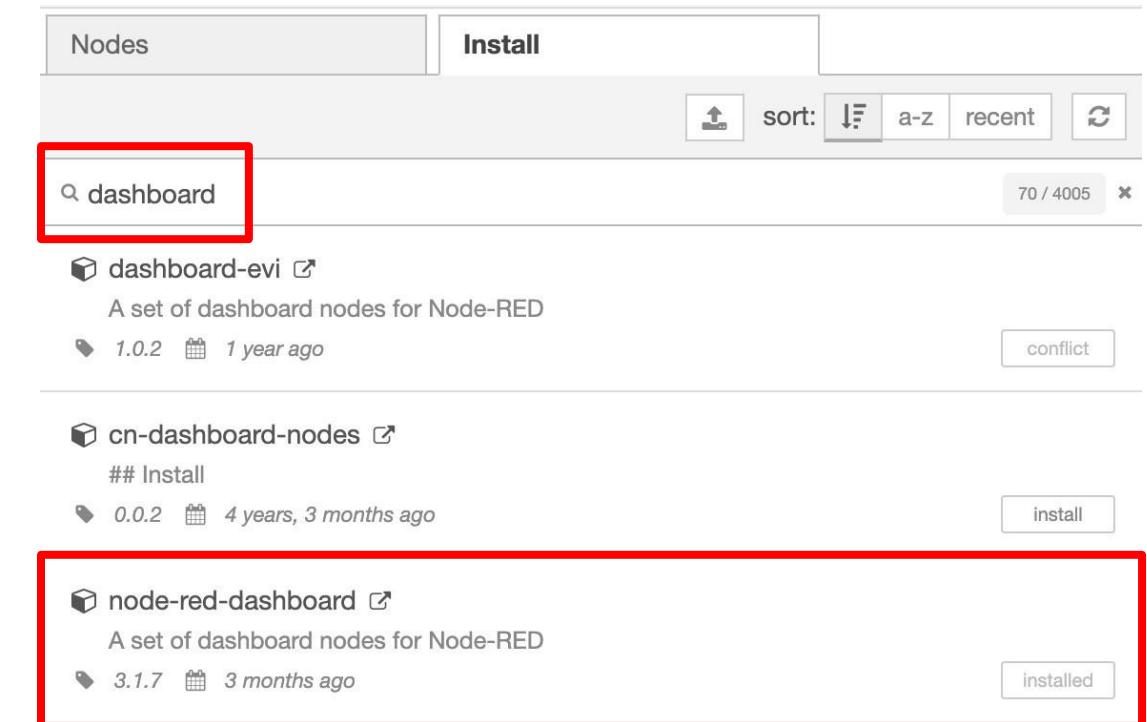

Battery 3.275V

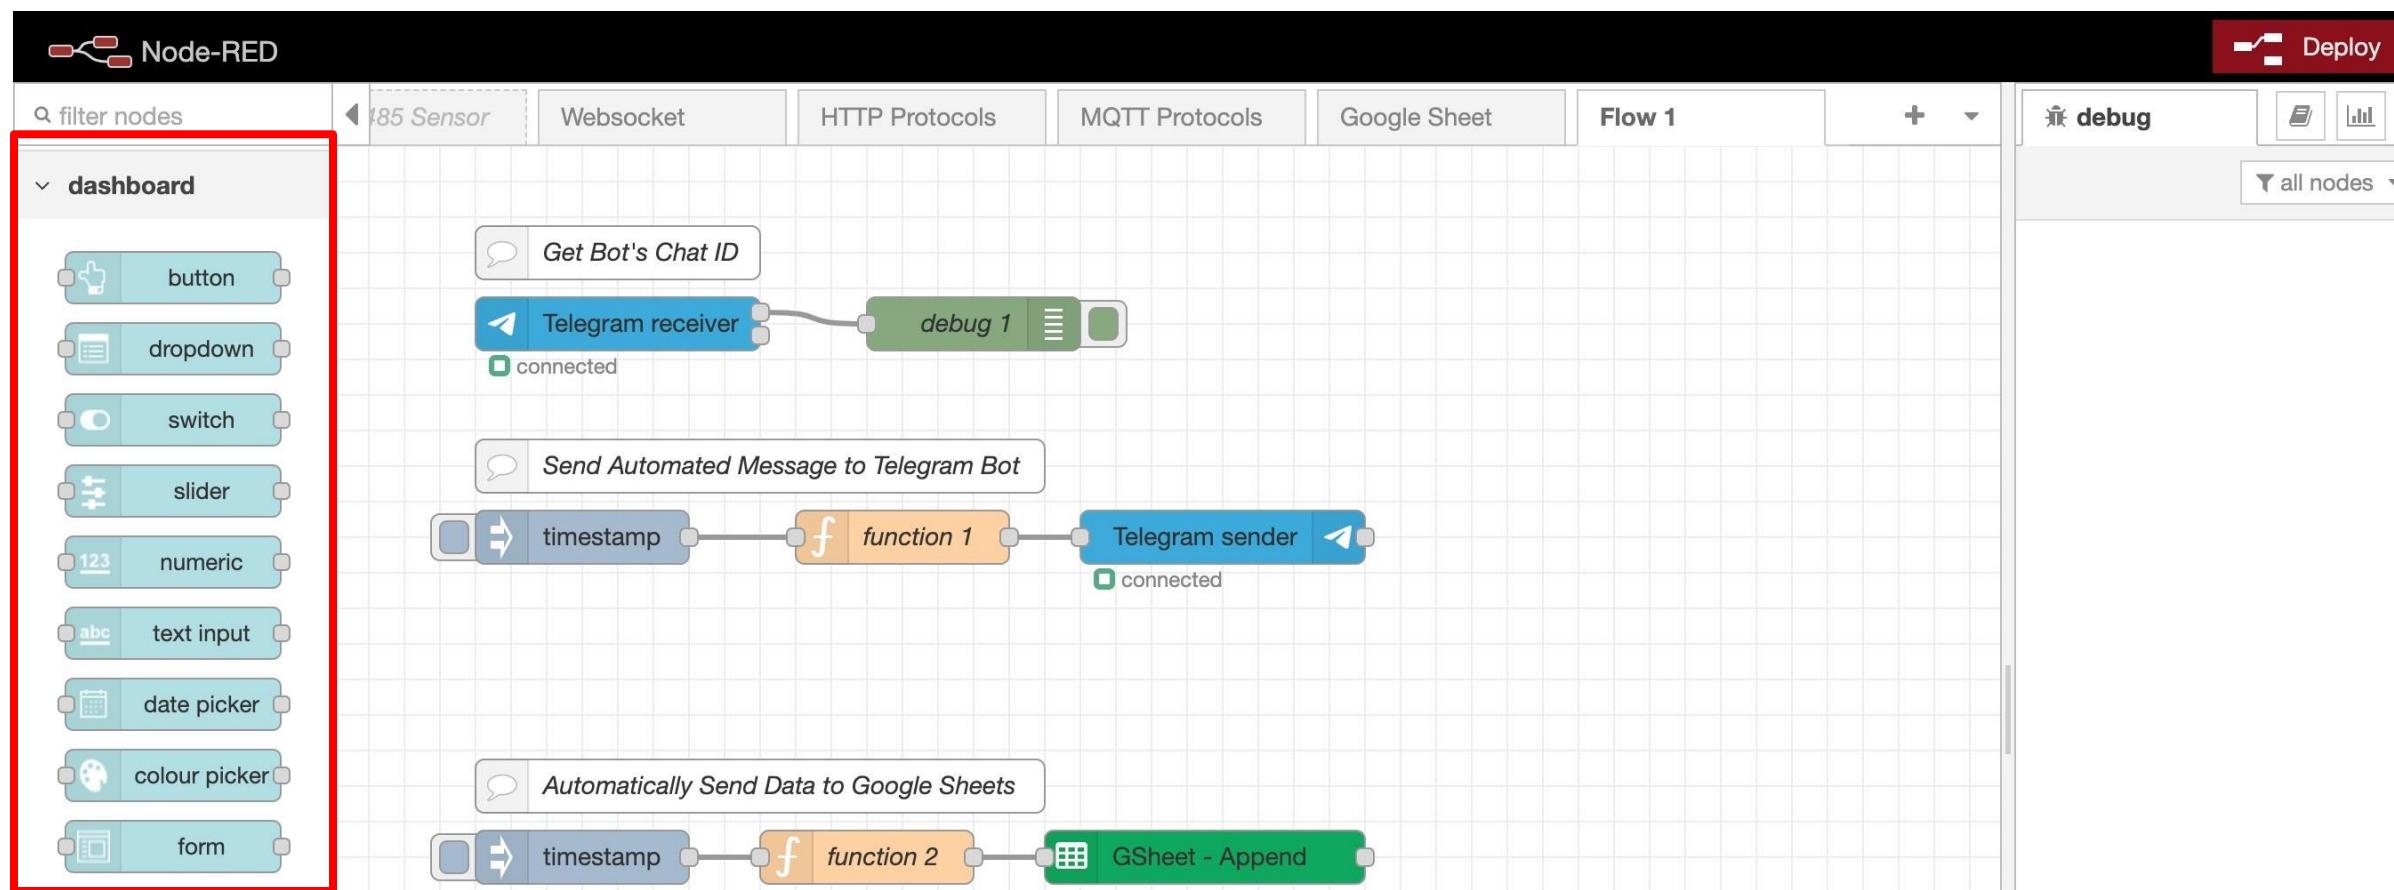

## Install Node-RED Dashboard

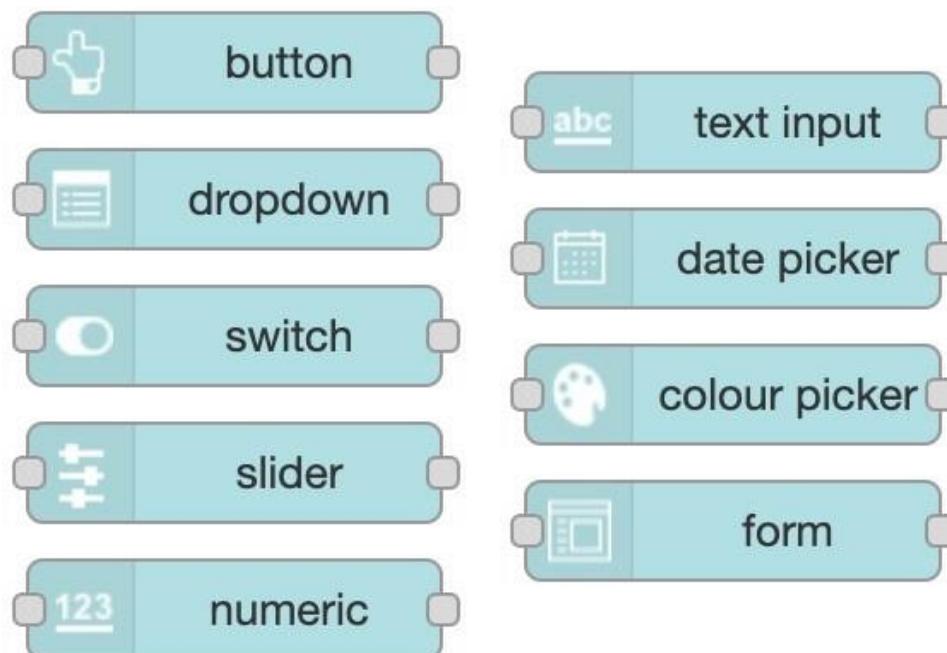

- Open Node-RED Palette Manager.
- Click on the **Install** tab and on the **search modules** fields type **dashboard** to filter the list of the available modules.
- Click the **install** button to install the **node-red-dashboard** module and wait until the installation process is successful.

- Once the installation is successful, the dashboard's widget as a set of Node-RED Dashboard nodes is available on the palette under new category: **dashboard**.

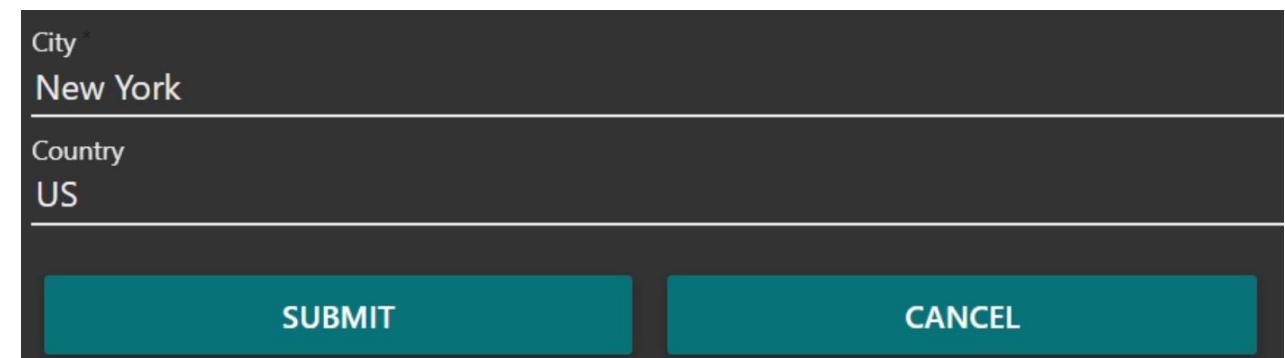

## Input UI nodes for the Dashboard

## Example of Input UI on the Dashboard

- Form and
- button

A screenshot of a Node-RED dashboard showing a 'form' node. The form contains two inputs:

- City: New York
- Country: US

Below the form are two teal buttons:

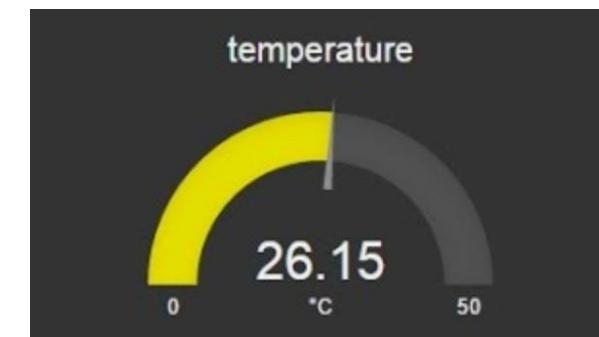

- SUBMIT
- CANCEL

## Output UI nodes for the Dashboard

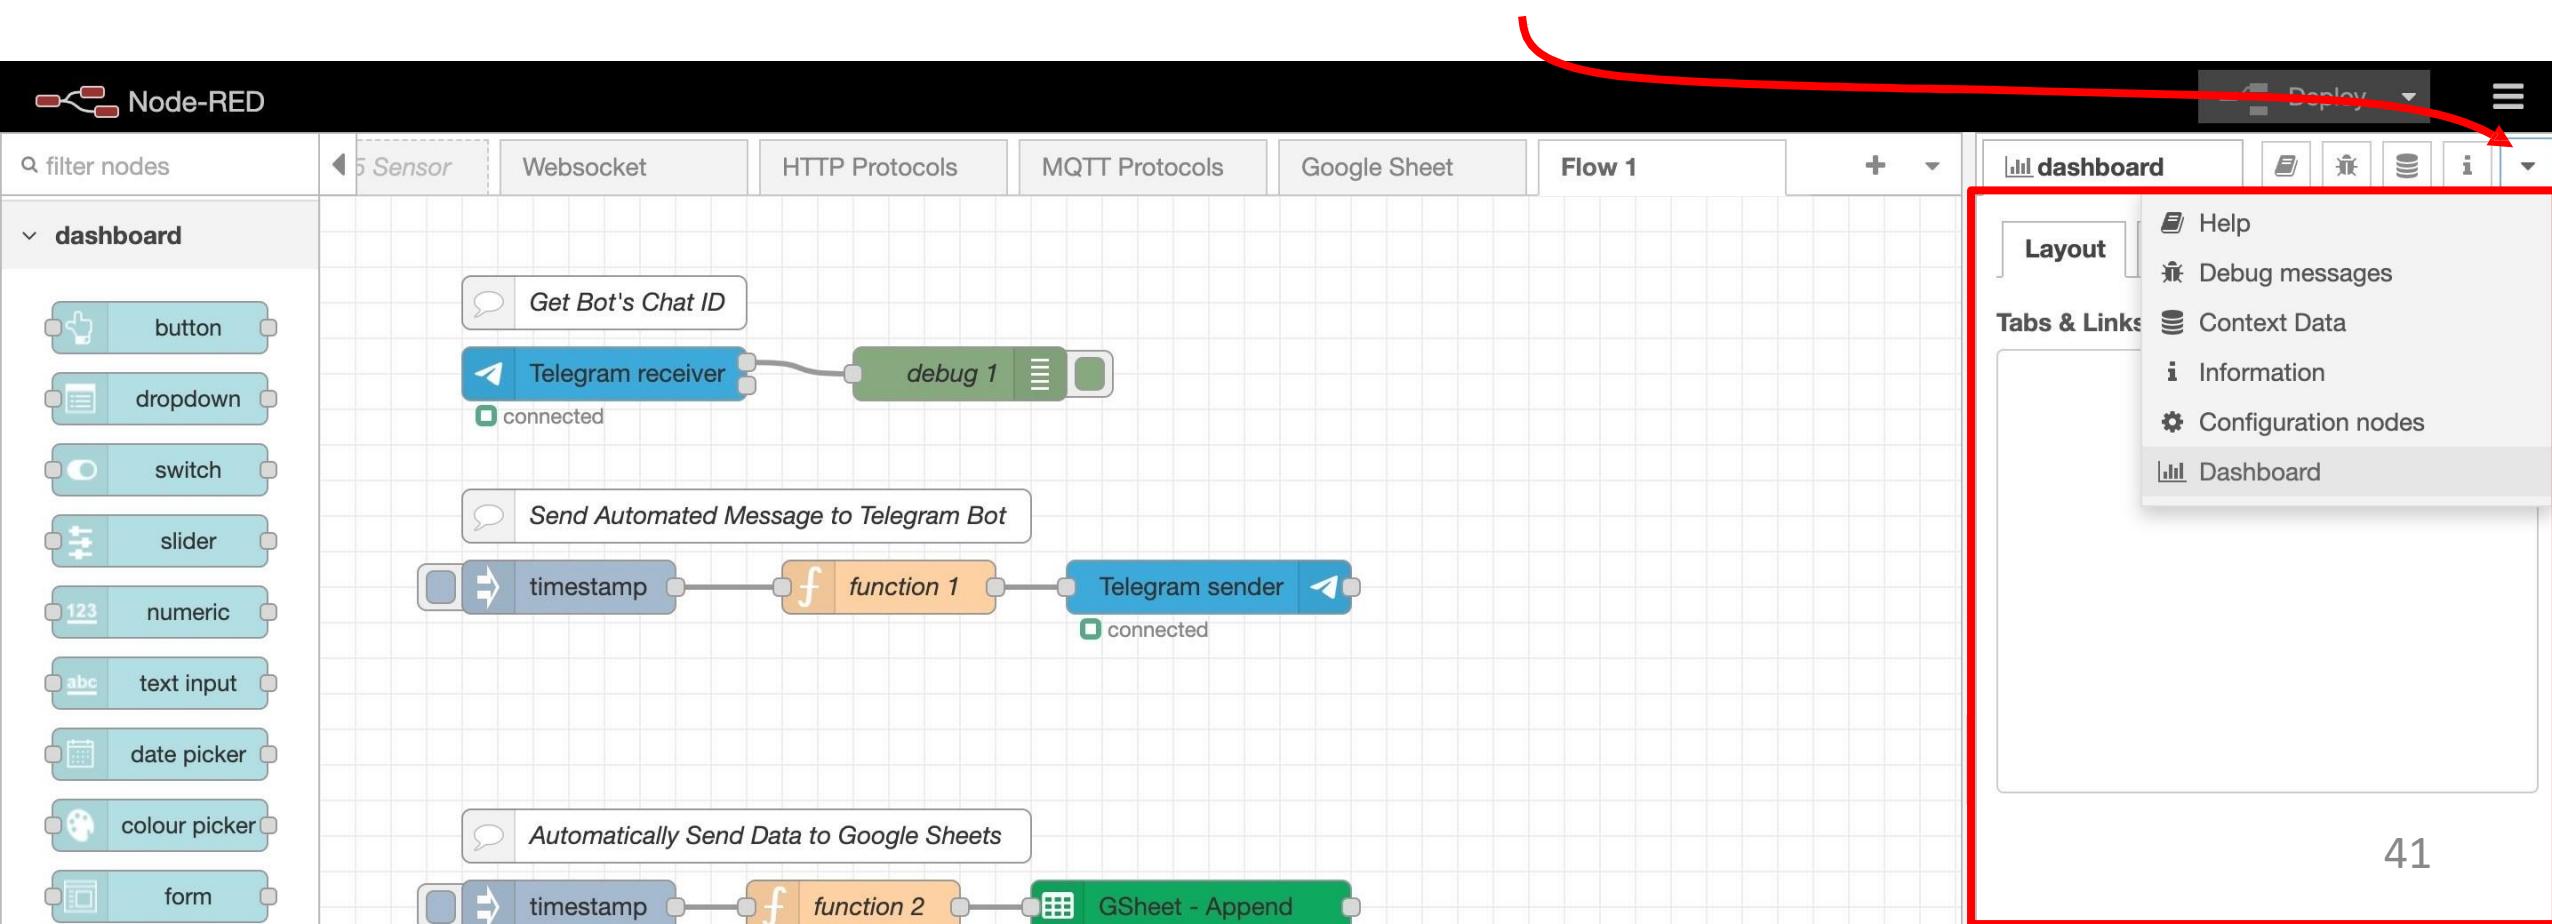

## Example of Input UI on the Dashboard

- Gauge and
- Chart

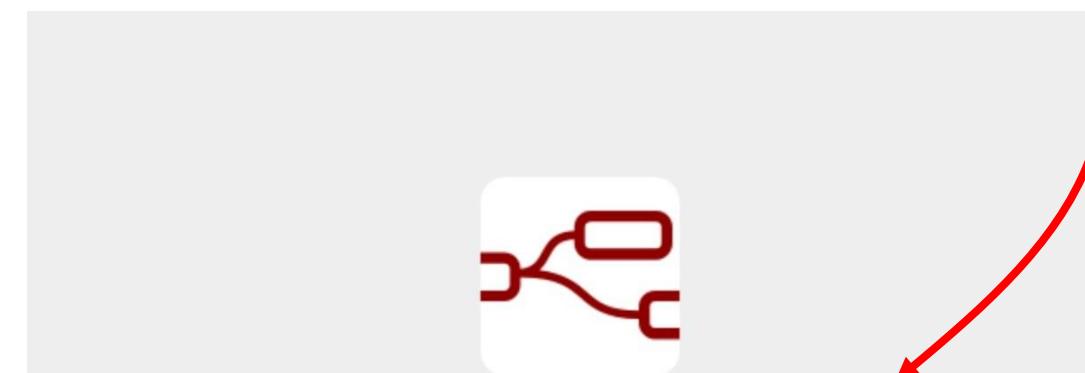

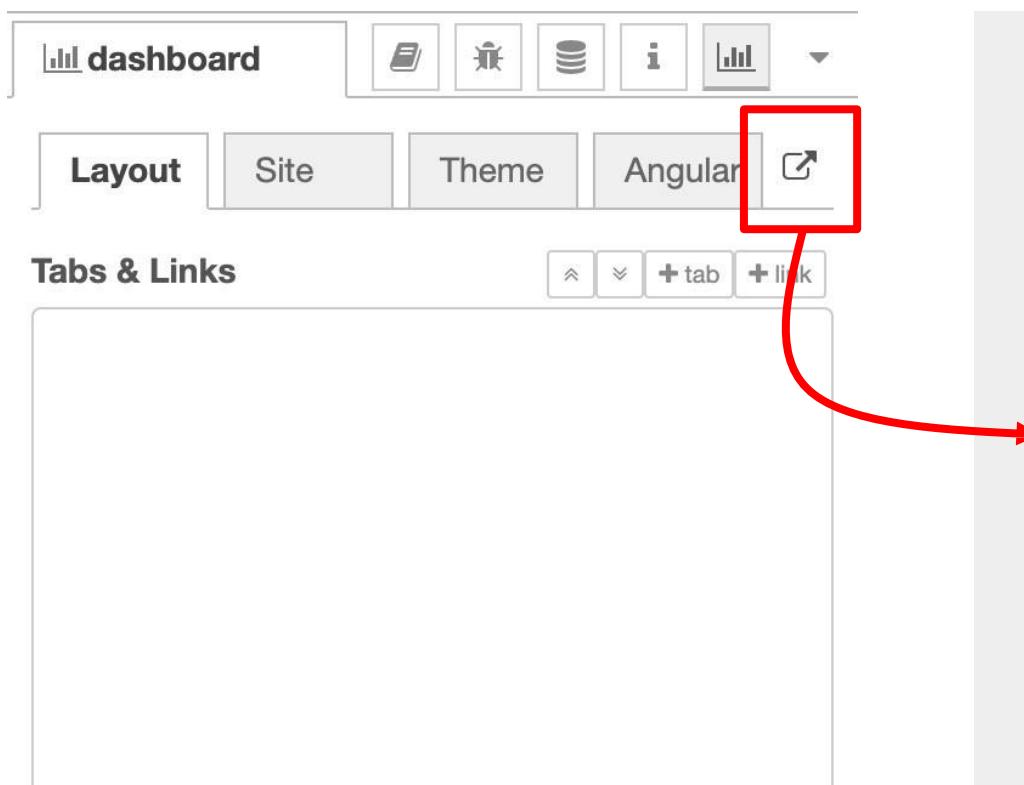

# Node-RED Dashboard

- Node-RED Sidebar also has a new tab specifically for dashboard configurations.
- The **dashboard** tab can be access by clicking the dropdown and select Dashboard.

There are two ways to access to Node-RED dashboard.

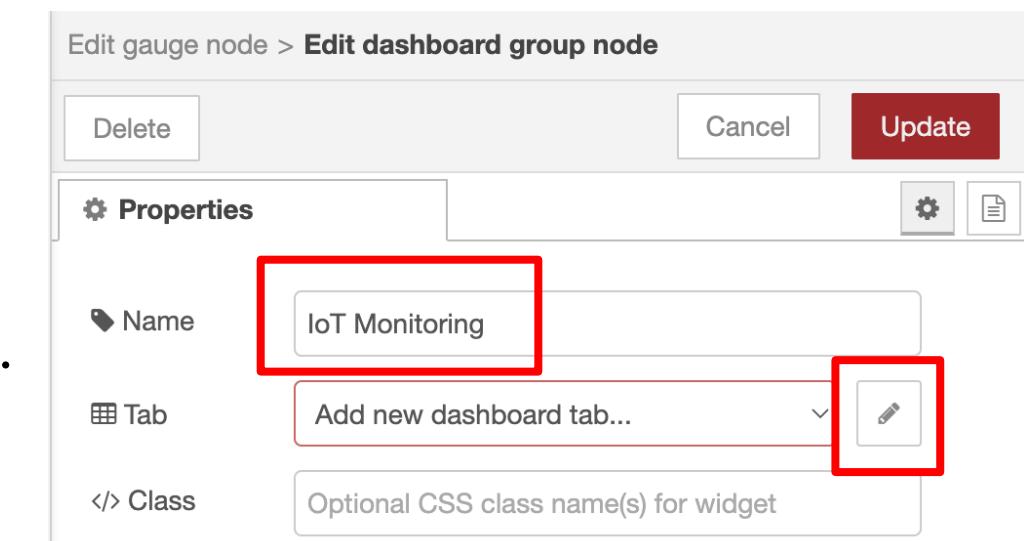

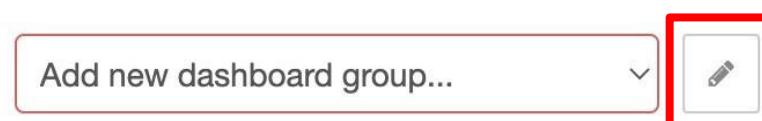

1. Go to the Node-RED URLs followed by `/ui`. For example, <http://localhost:1880/ui>
2. Click the **external icon** on the Dashboard tab under Node-RED sidebar.

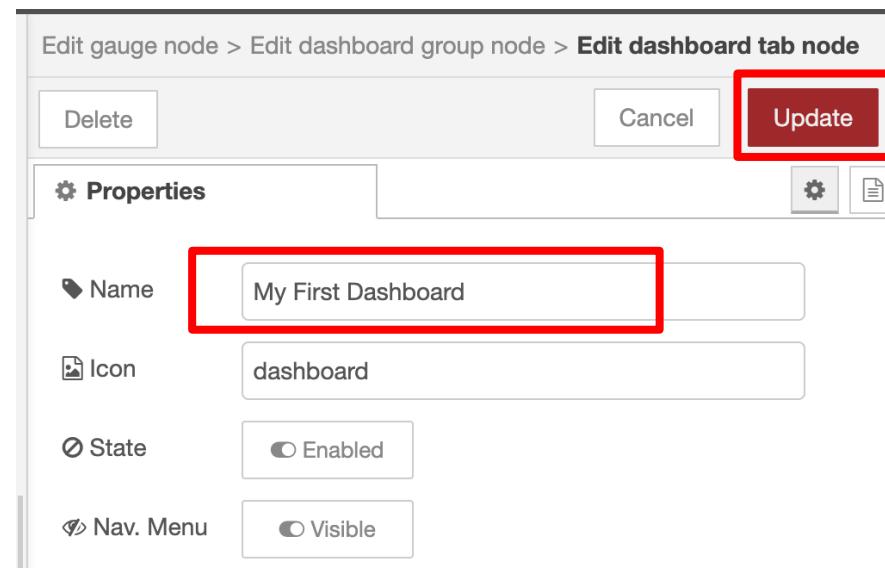

## Add Gauge widget to the Node-RED Dashboard (17 Steps)

1. Insert **gauge** node into the workspace.
2. Double click the node to edit the properties.
3. Setup the dashboard's group by clicking the pencil icon.

4. Rename the group's name, such as **IoT Monitoring**.
5. Click the pencil icon to add new dashboard tab.

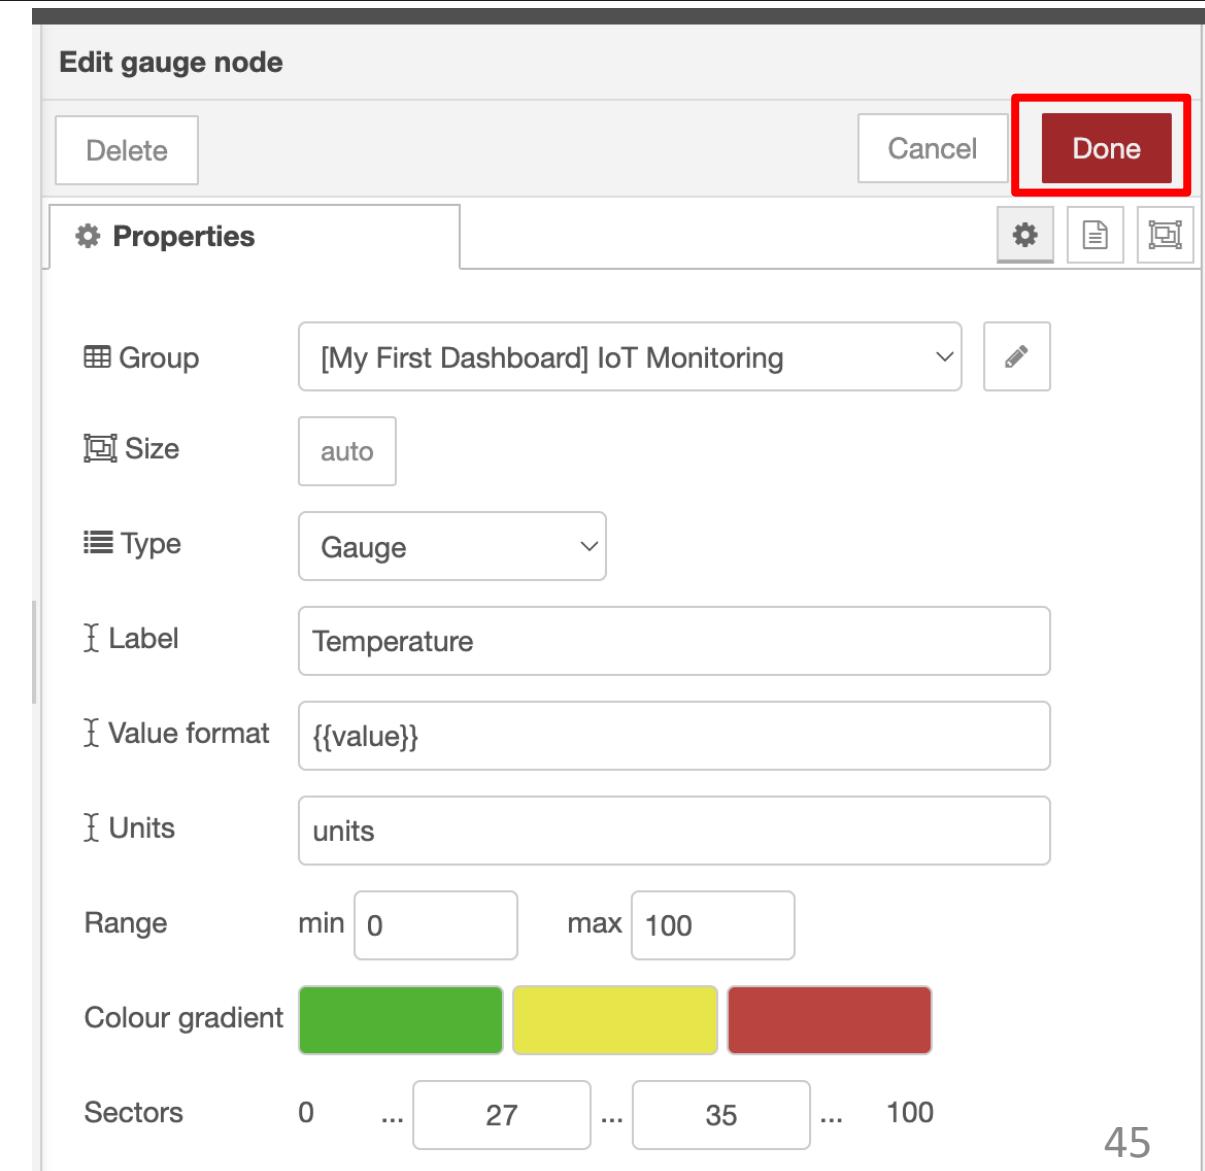

6. Rename the dashboard's tab name, such as **My First Dashboard**.
7. Click the **Add** button to add the new dashboard's tab.

8. Click the **Add** button to add the group.

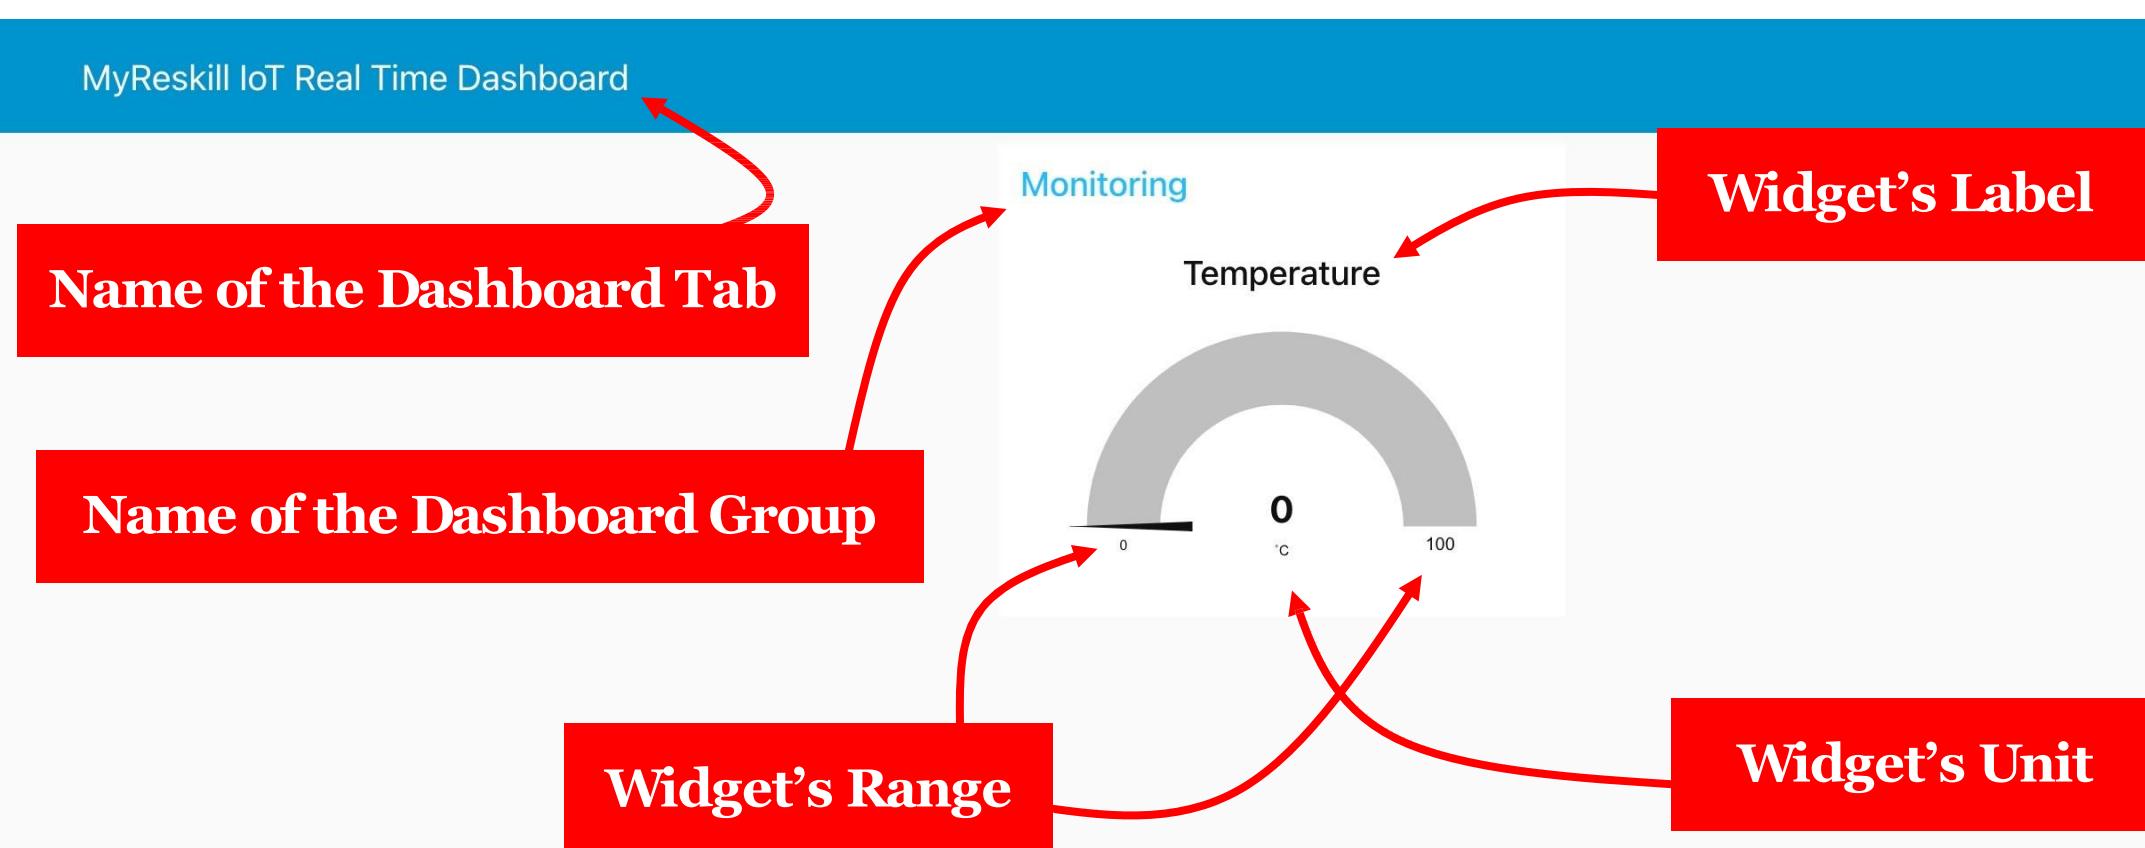

9. Remain the type of the gauge is **Gauge**.
10. Rename the label to **Temperature**.
11. Format of the value remain **{{value}}**.
12. Insert the unit as Degree Celsius symbol.
13. Range of the value, min: 0 and max: 100.
14. Other configurations is default.
15. Click the **Done** button to save the configurations.
16. Click the **Deploy** button.
17. Access the Node-RED Dashboard URL to view the dashboard with the Gauge widget.

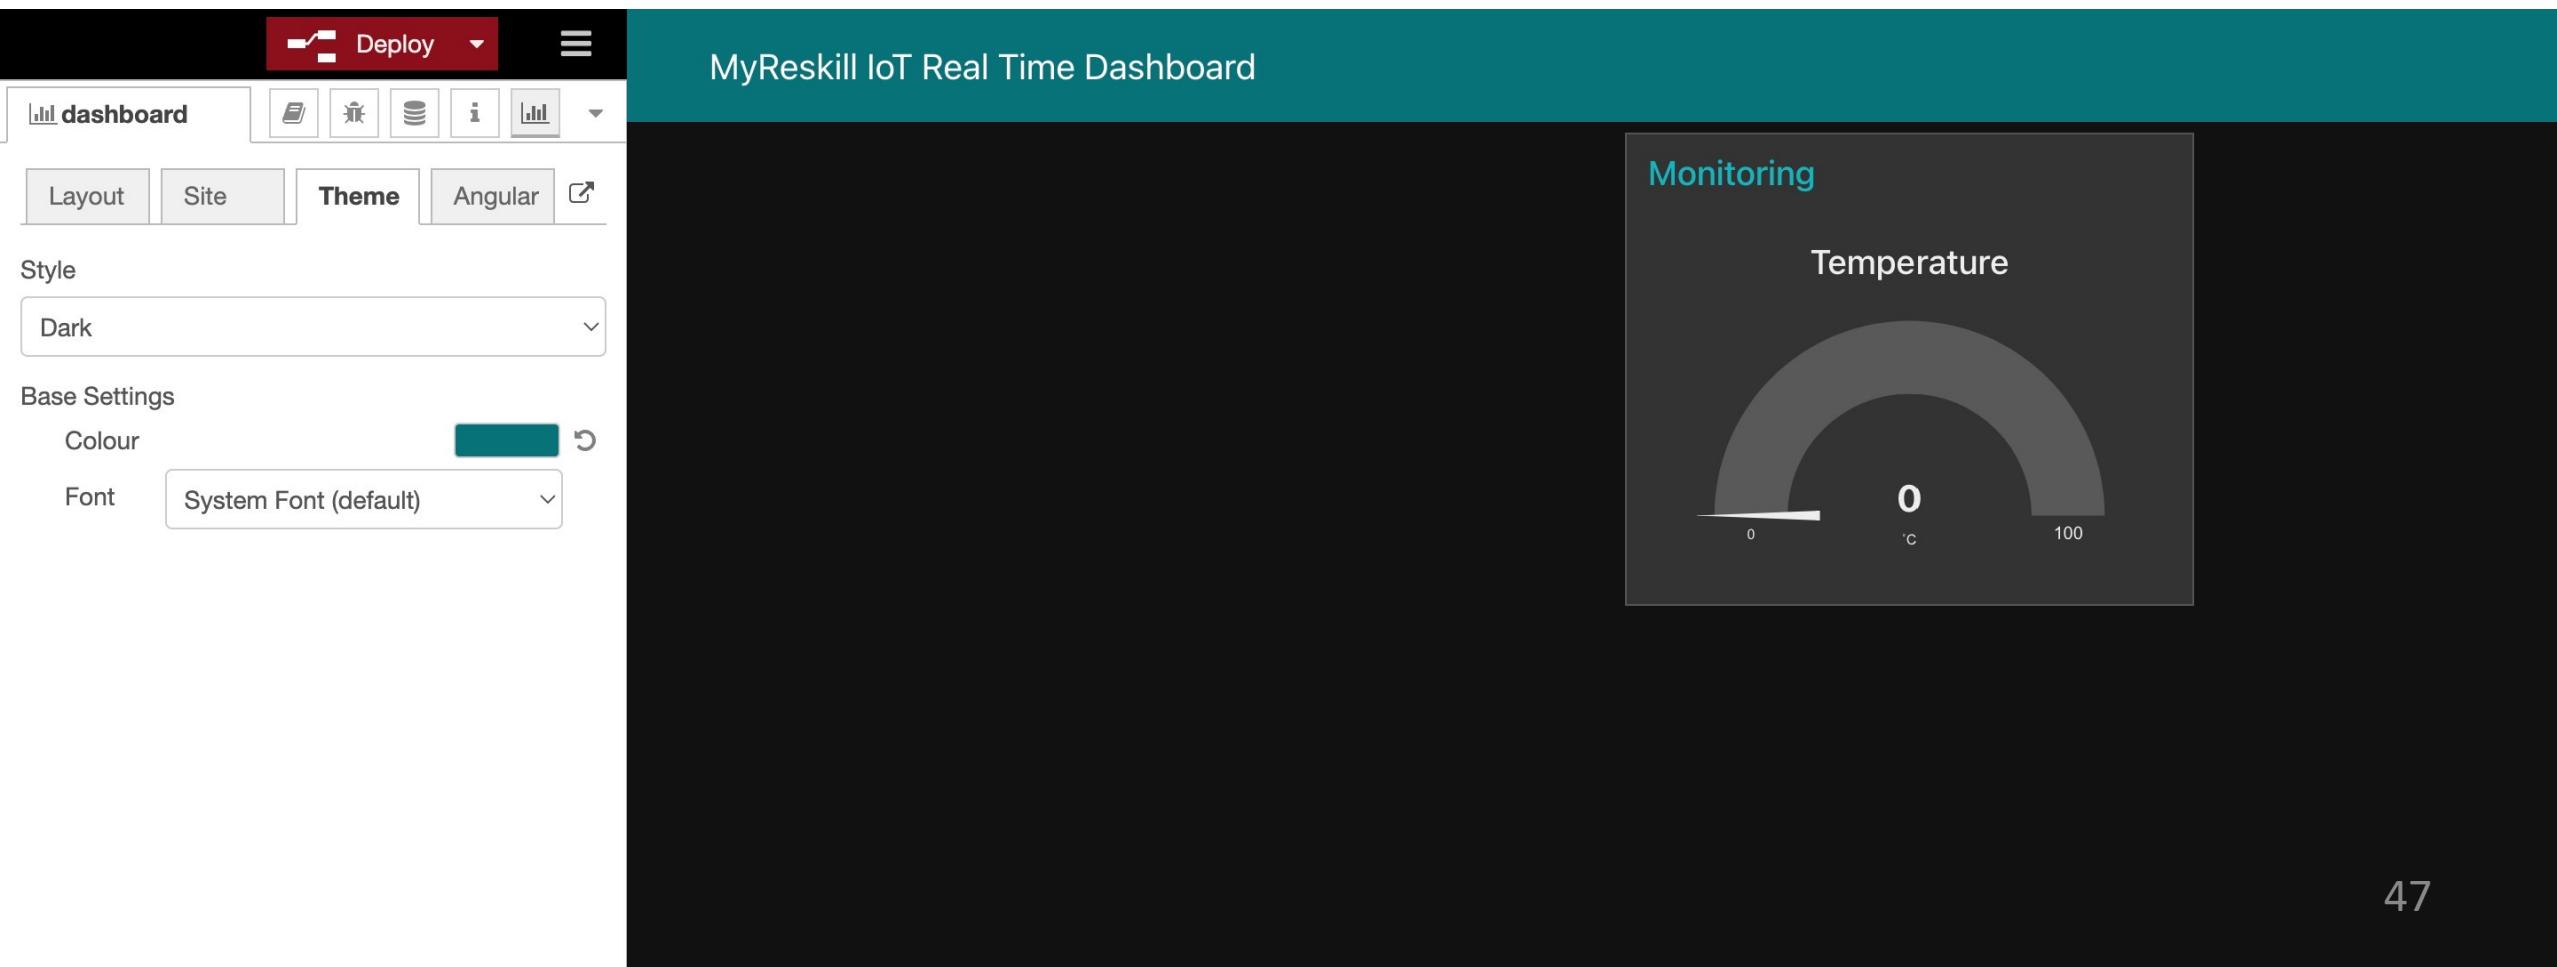

# Node-RED Dashboard

Node-RED Dashboard light theme (default) with the Gauge widget.

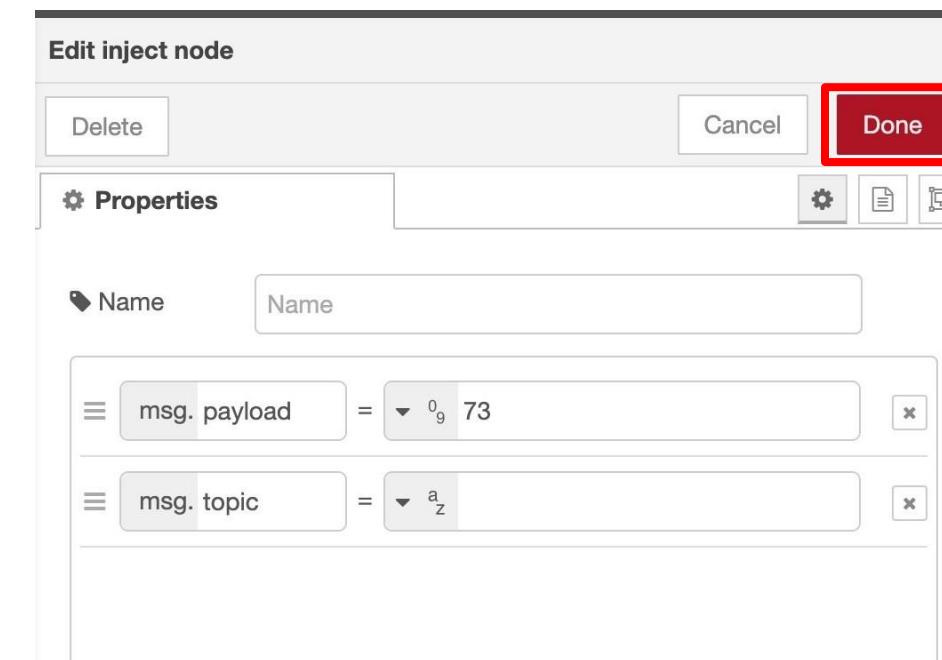

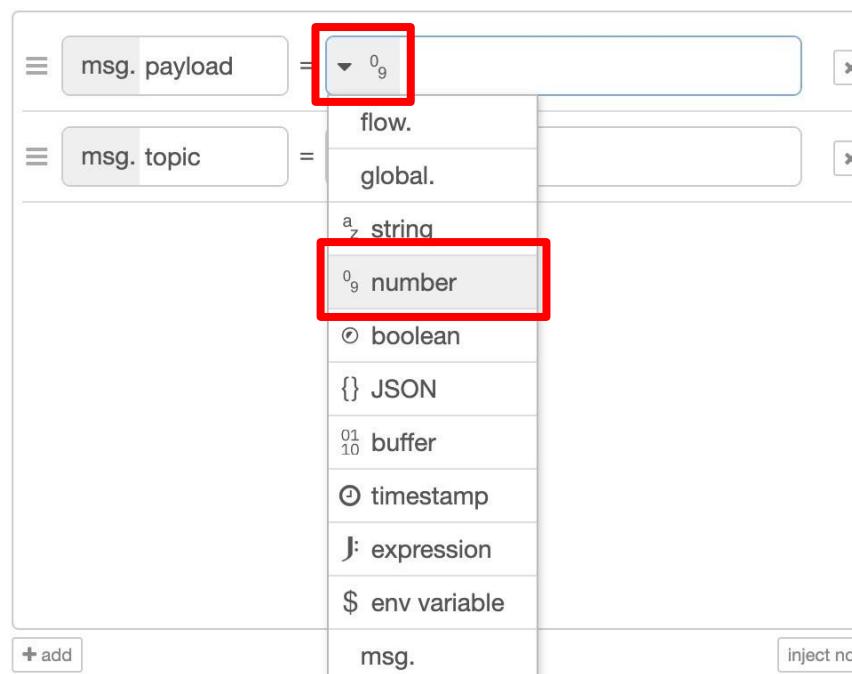

Node-RED Dashboard Theme Dark.

The screenshot shows the Node-RED dashboard configuration interface on the left and a preview of the dashboard on the right. The configuration interface includes a 'Deploy' button, a toolbar with icons for dashboard, site, theme, and angular, and sections for 'Style' (set to 'Dark') and 'Base Settings' (color set to teal). The preview shows a teal header with the title 'MyReskill IoT Real Time Dashboard'. Below the header is a dark monitoring card titled 'Monitoring' with a sub-section 'Temperature'. It features a circular gauge with a scale from 0 to 100 degrees Celsius, with the value '0' displayed at the center.

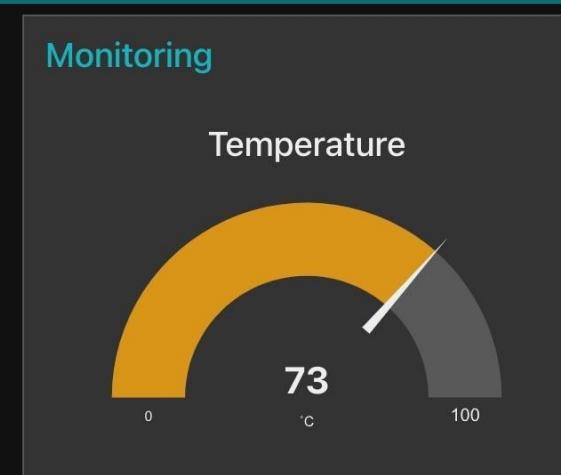

## Send Dummy Data to Gauge Widget (6 Steps)

1. Insert the **Inject** node into the workspace.
2. Double click the node and change the **msg.payload** data type to **number** and insert dummy value, such as 73 or 28 and click the **Done** button.

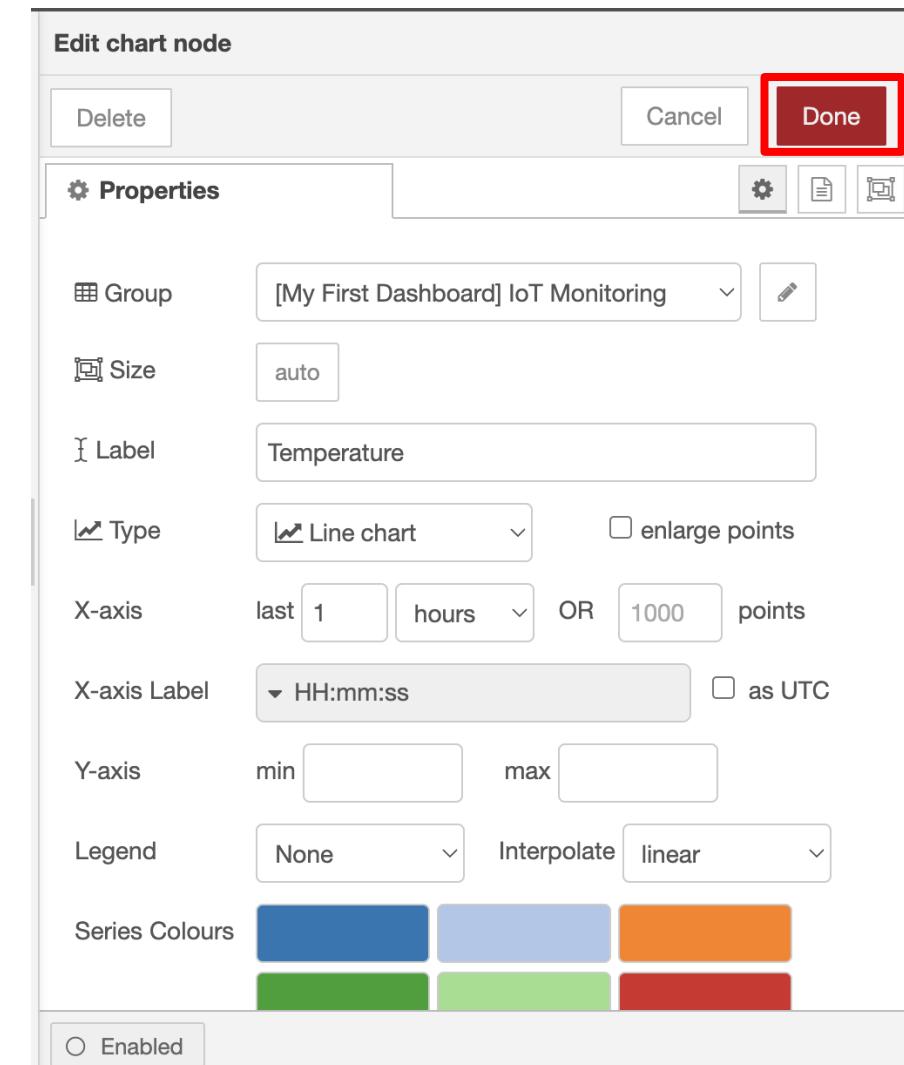

3. Connect both of the nodes, the inject node and the gauge node.
4. Click the **Deploy** button.
5. Click the inject node button to inject the data to the gauge node.
6. View the dashboard for real-time data update.

## MyReskill IoT Real Time Dashboard

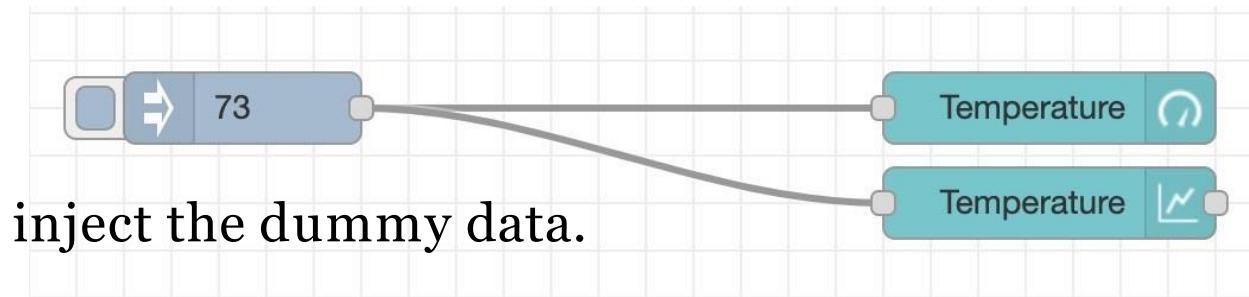

## Add Chart widget to the Node-RED Dashboard (13 Steps)

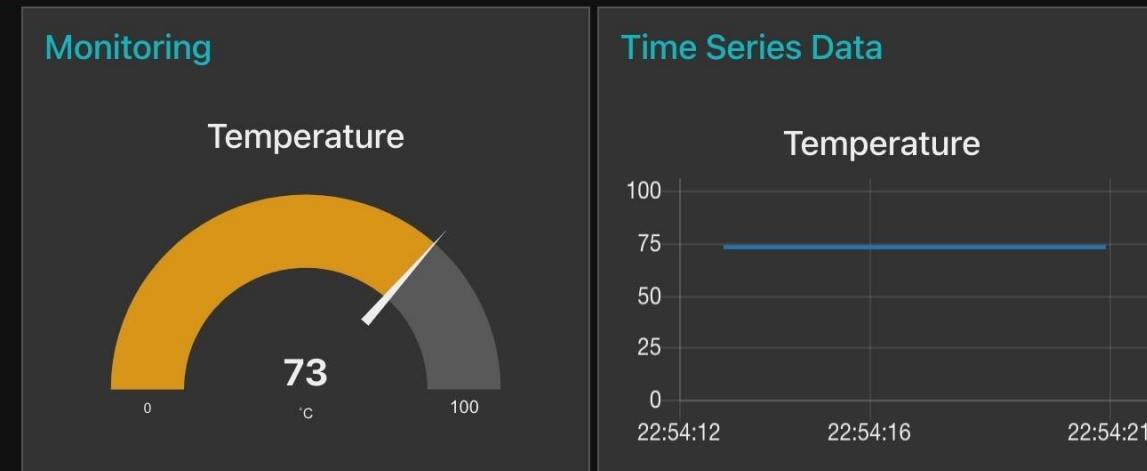

1. Insert **chart** node into the workspace.
2. Double click the node to edit the properties.
3. Click the group and choose **Add new dashboard group...**
4. Click the **pencil icon**.
5. Change the default group name to **Time Series Data**.
6. Click the **Add** button to continue.
7. Change the label to **Temperature**.
8. Y-axis, min value is 0 and max value is 100.
9. Click the **Done** button.
10. Connect the **chart** node with the dummy data **inject** node.

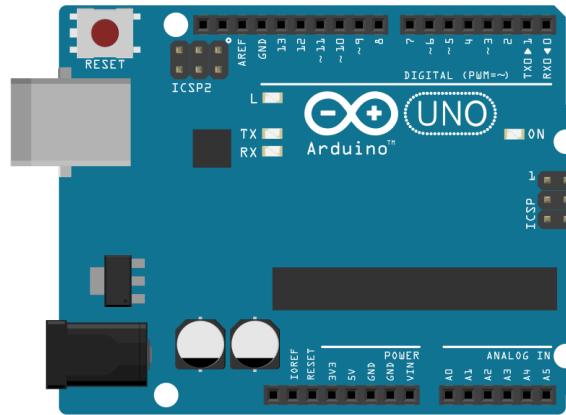

11. Click the **Deploy** button.
12. Click the **inject** node button several time to inject the dummy data.
13. View the dashboard for real-time data update.

## MyReskill IoT Real Time Dashboard

# Getting Started with Arduino UNO

Setting up Arduino UNO with input and output

# Getting Started with UNO

**Microcontroller:** ATmega328

**Operating Voltage:** 5V

**Input Voltage (recommended):** 7-12V

**Input Voltage (limits):** 6-20V

**Digital I/O Pins:** 14 (of which 6 provide PWM output)

**Analog Input Pins:** 6

**DC Current per I/O Pin:** 40 mA

**DC Current for 3.3V Pin:** 50 mA

**Flash Memory:** 32 KB (ATmega328)

**SRAM:** 2 KB (ATmega328)

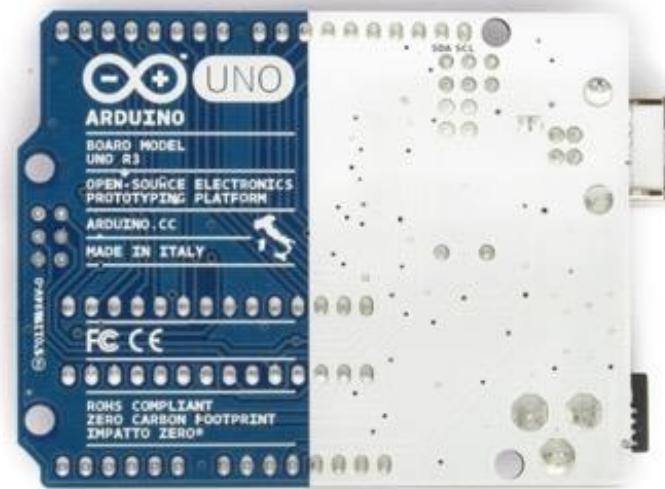

**EEPROM:** 1 KB (ATmega328)

**Clock Speed:** 16 MHz

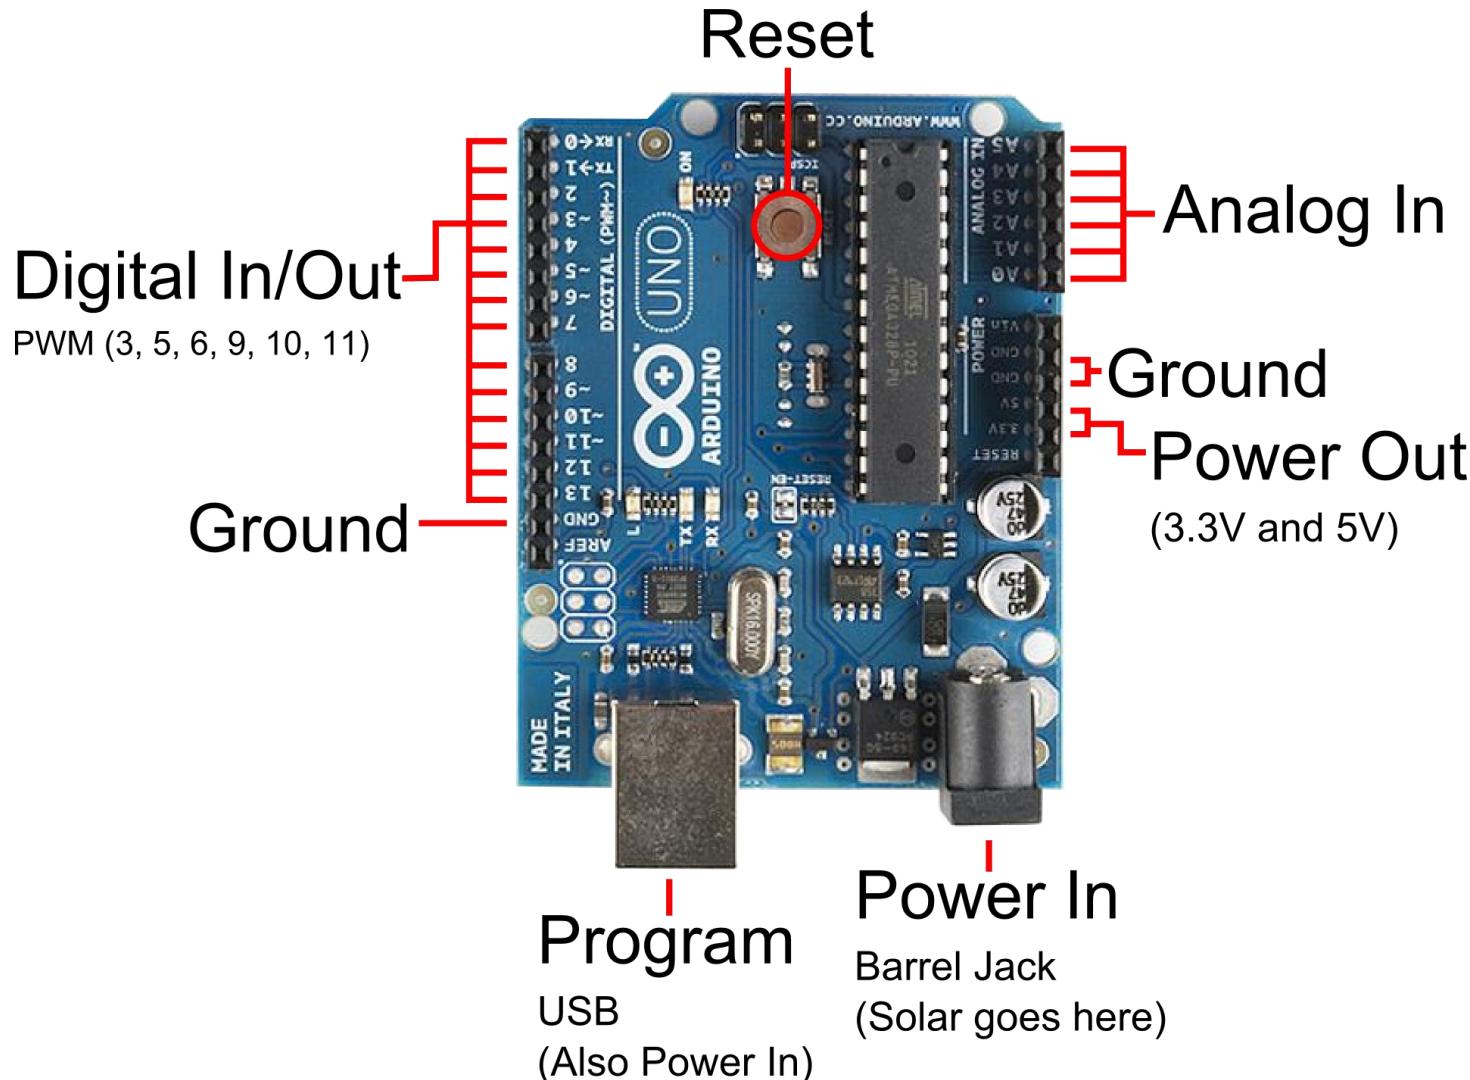

**Length:** 68.6 mm

**Width:** 53.4 mm

**Weight:** 25 g

# Getting Started with UNO

## The washing machine comparison

Microcontrollers are **dedicated** to one task and run one specific program.

Examples of tasks could be:

- i. Received from inputs via ports (read from external hardware)
- ii. Stored data in file registers & arithmetic operations (added, subtracted, logic gates)
- iii. Sent out data (control external hardware)

Processor, Storage and RAM all in one tiny package

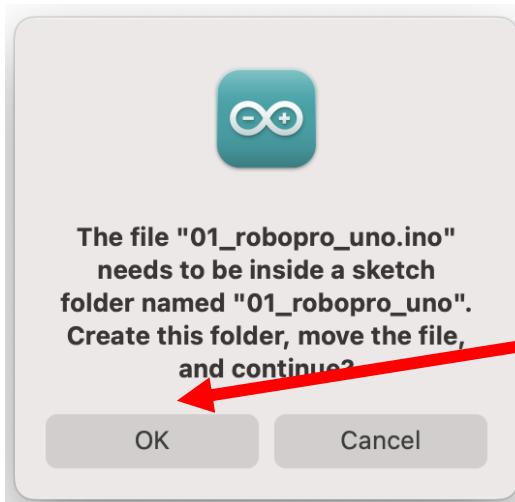

# Getting Started with UNO

## Let's build your 1st program!

1

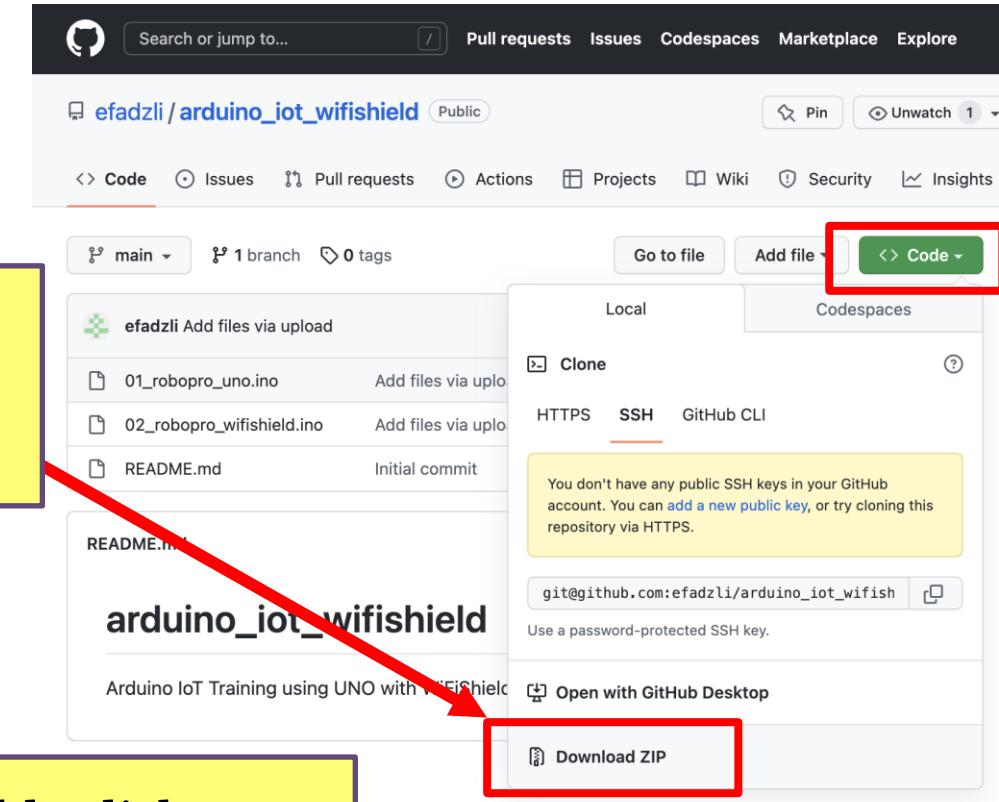

Download the **ZIP** file from  
[https://github.com/efadzli/arduino\\_iot\\_wifishield](https://github.com/efadzli/arduino_iot_wifishield)

Code > Download ZIP

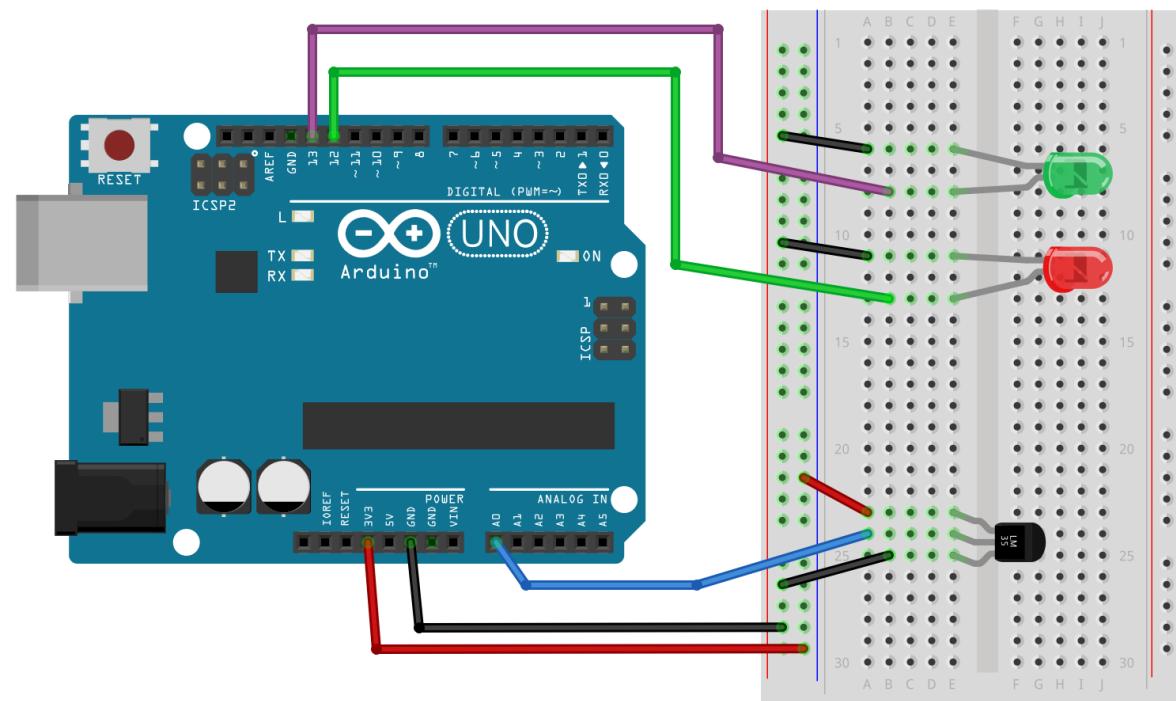

Unzip the file and double click  
**01\_robopro\_arduino.ino** file to open it  
 in Arduino IDE. Click OK when  
 prompted.

2

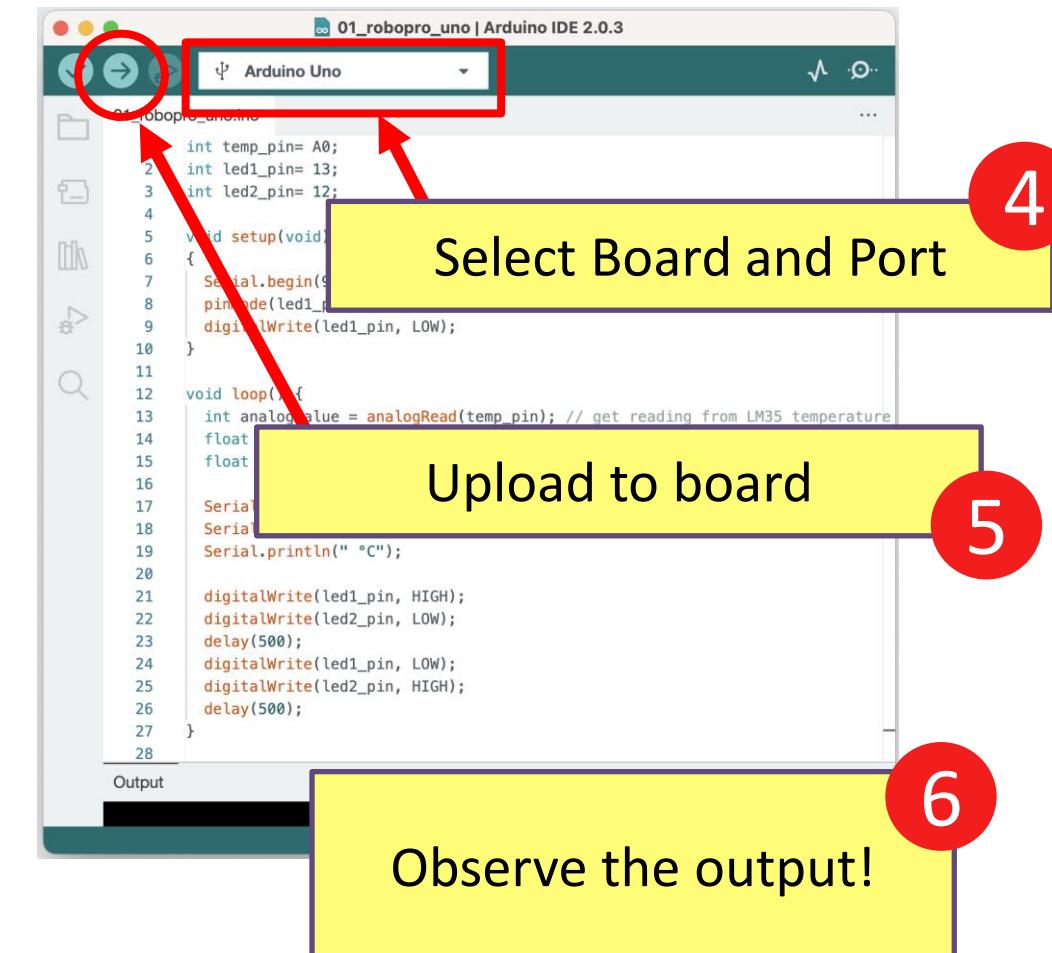

# Getting Started with UNO

3

Setup this board

4

Select Board and Port

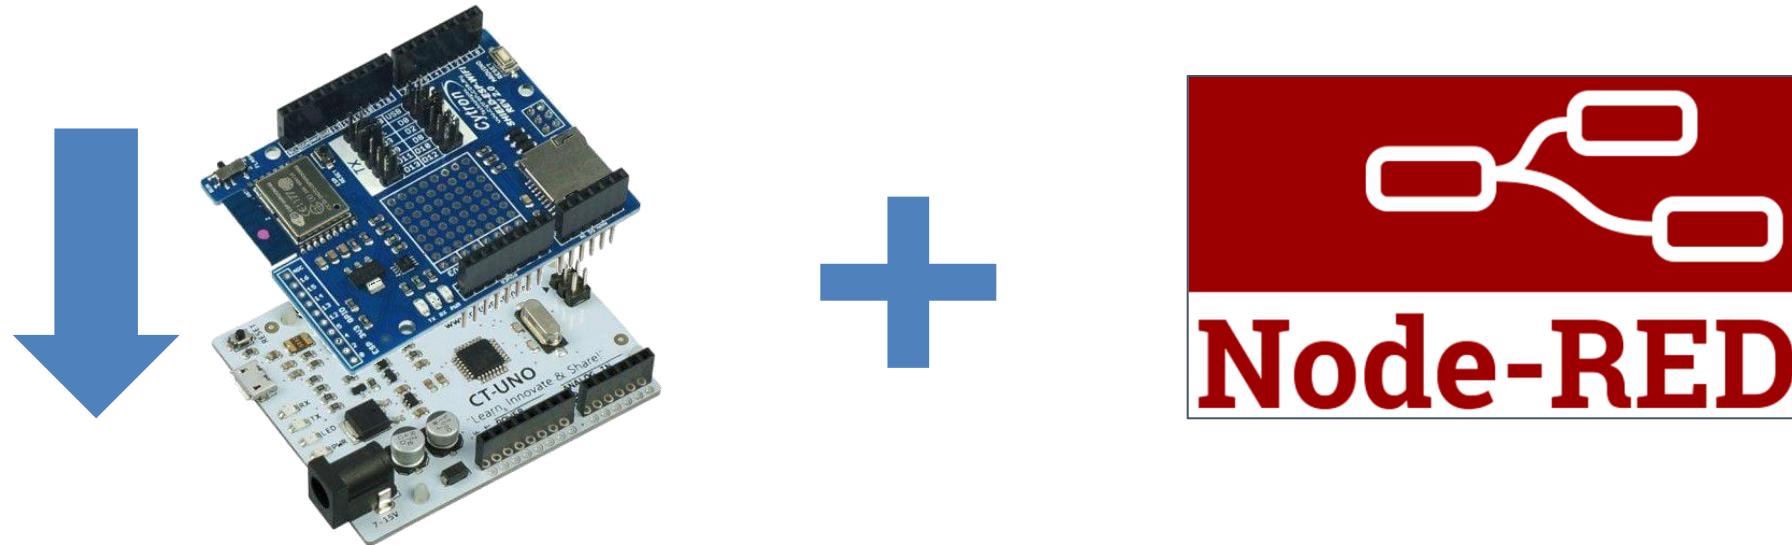

5

Upload to board

6

Observe the output!

Download the **01\_robopro\_arduino.ino** file from  
[https://github.com/efadzli/arduino\\_iot\\_wifishield](https://github.com/efadzli/arduino_iot_wifishield)

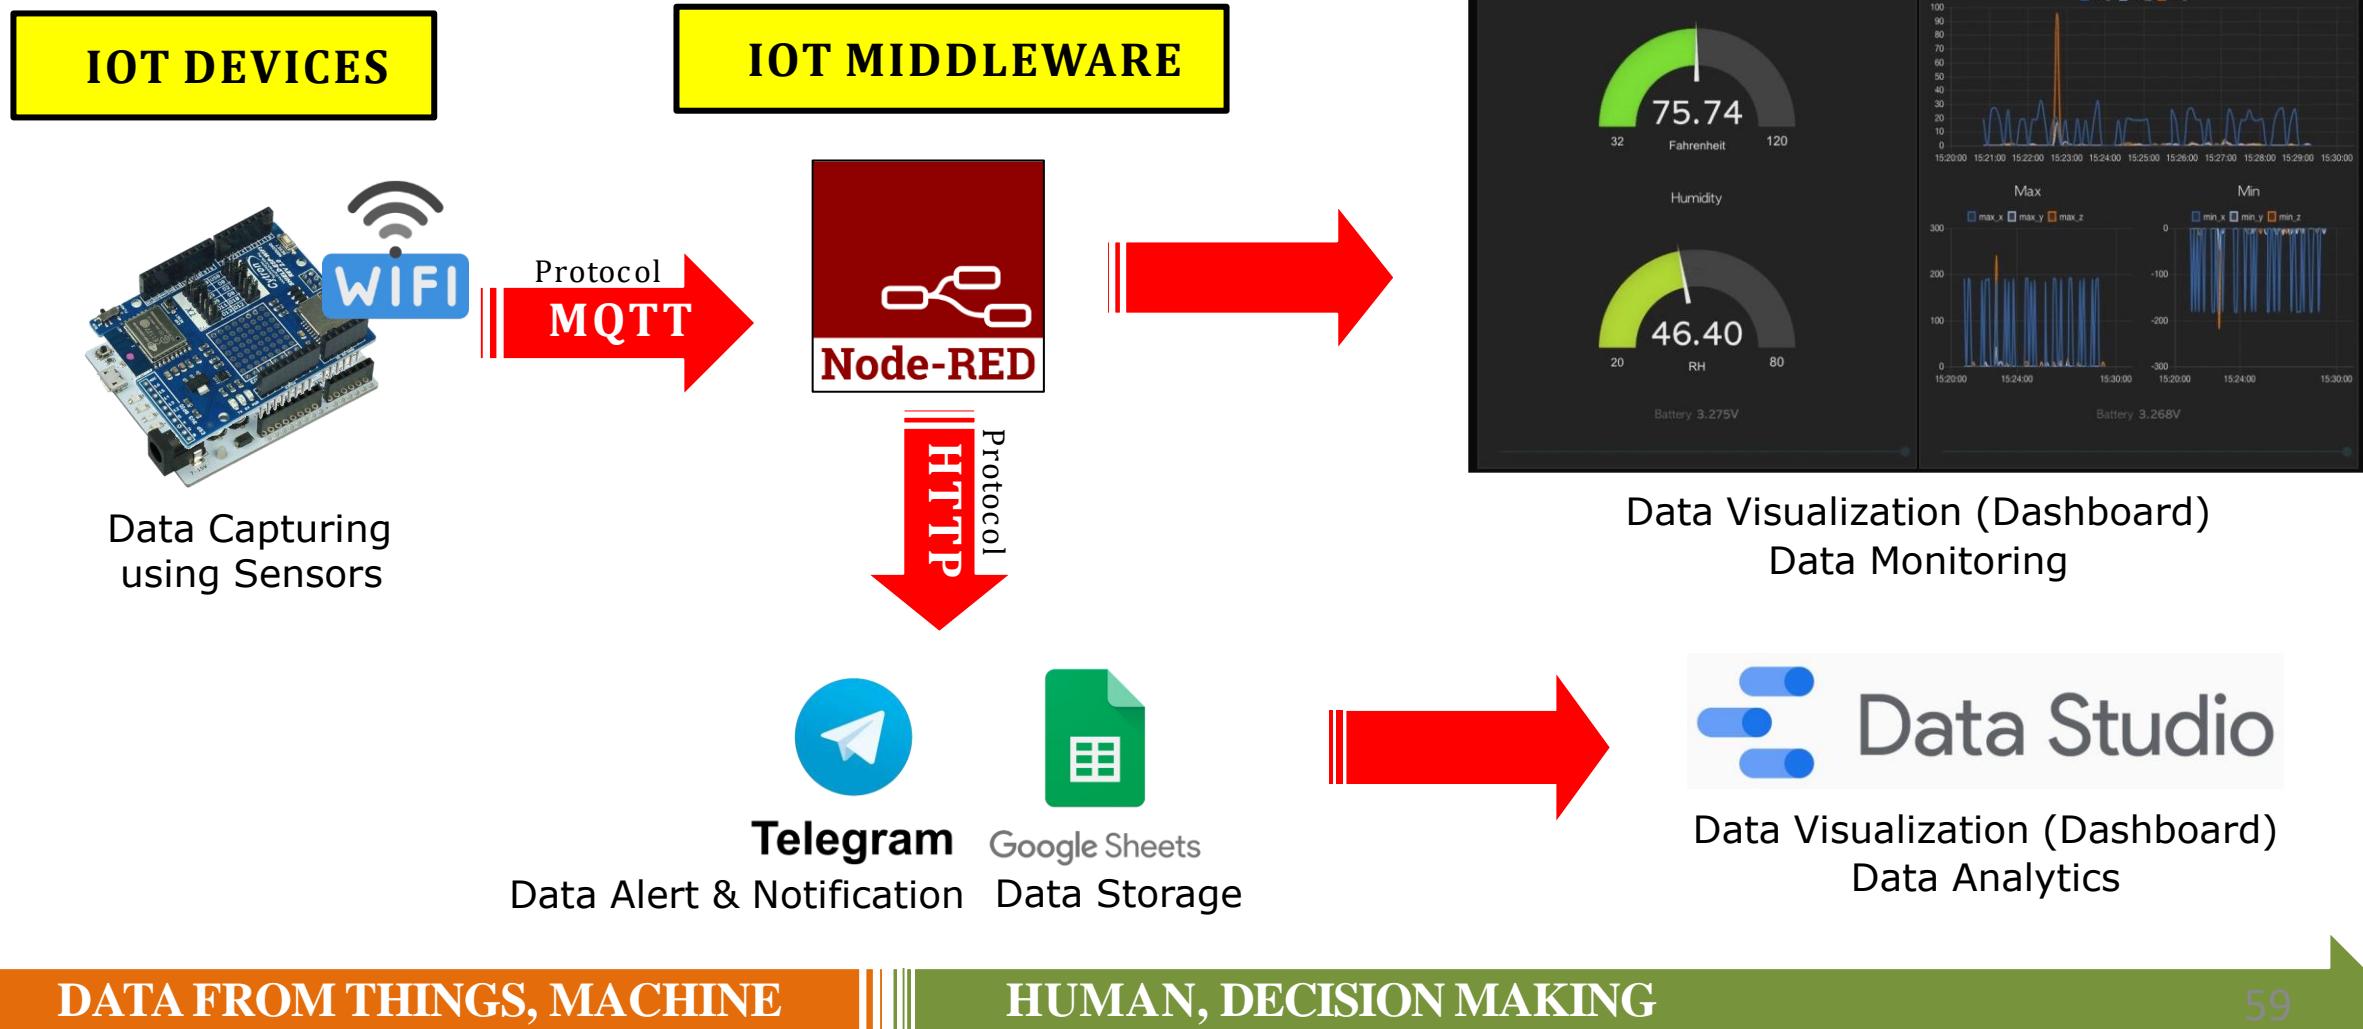

# UNO + WiFi Shield & Node-RED

Integrating the IoT devices with the IoT middleware

# Introduction to Node-RED

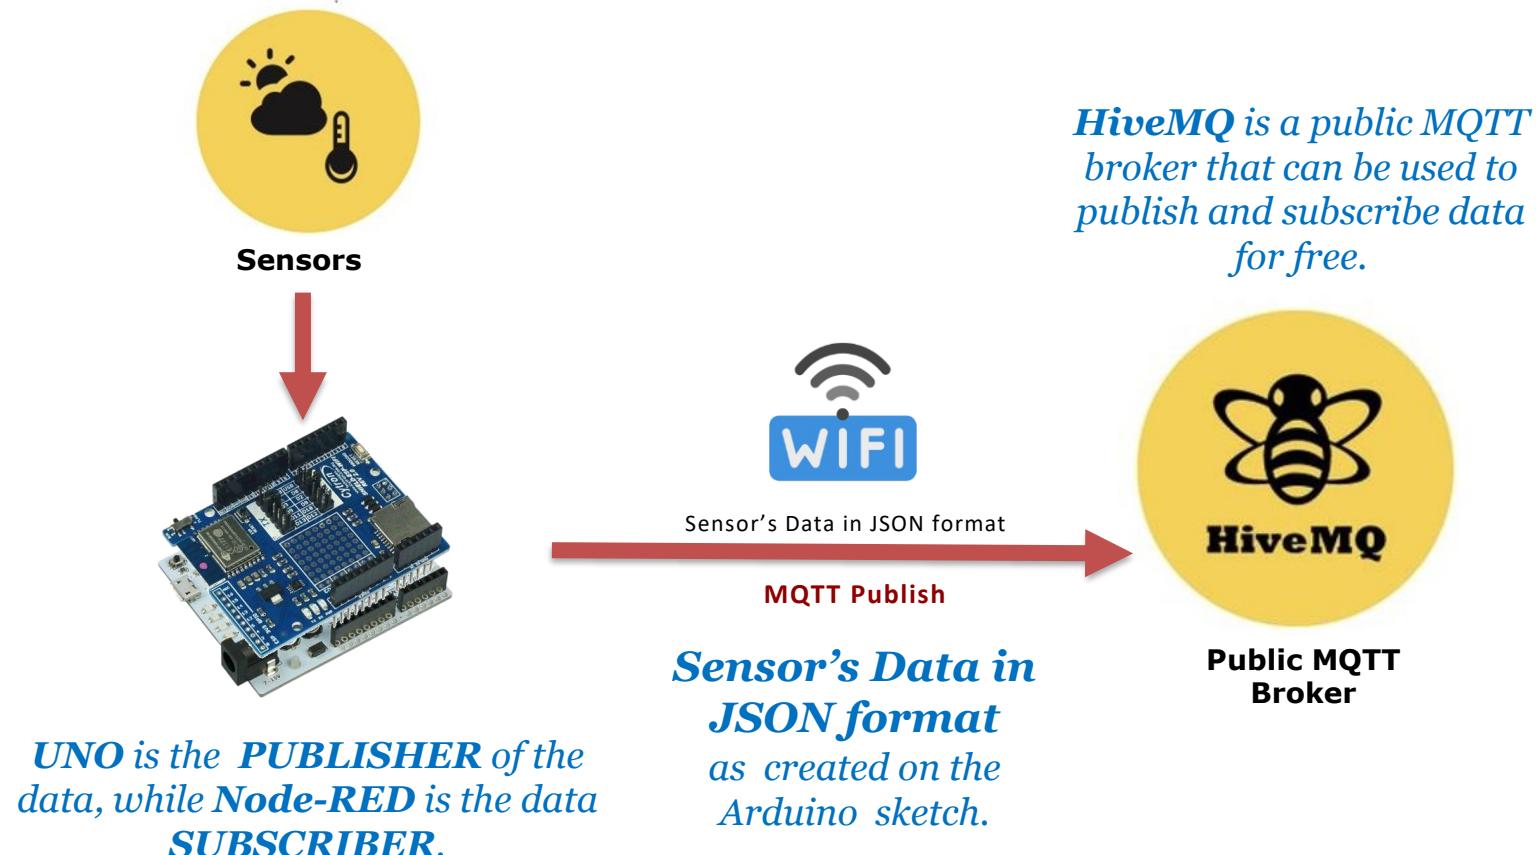

Basic IoT architecture using Node-RED as the middleware.

# UNO publish MQTT to Broker

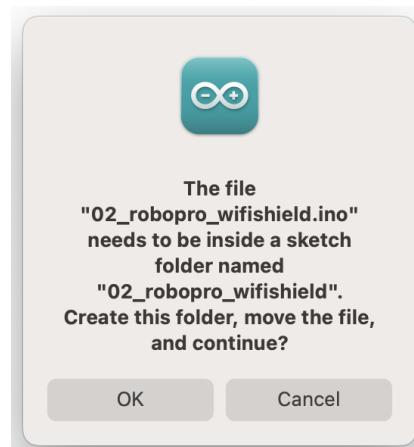

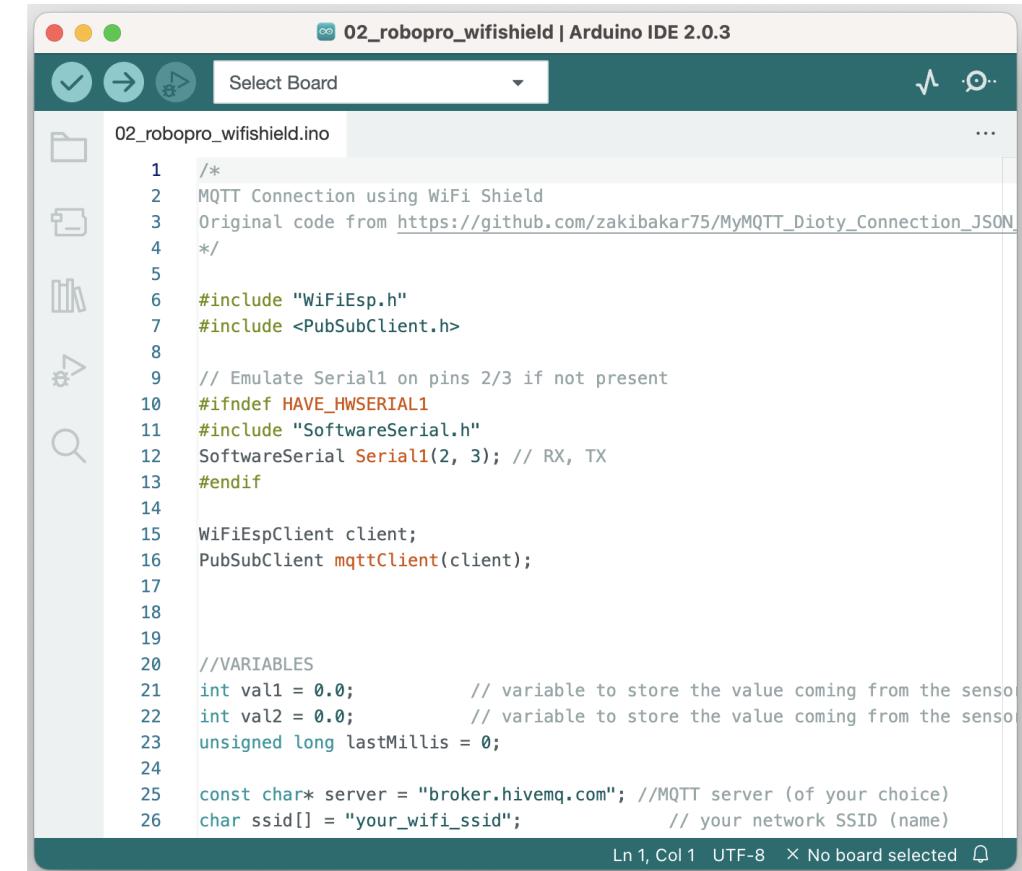

*The connectivity of UNO with HiveMQ public MQTT broker.*

## The architecture:

## Open UNO Example Sketch (3 Steps)

1. Download the **02\_robopro\_wifishield.ino** file from [https://github.com/efadzli/arduino\\_iot\\_wifishield](https://github.com/efadzli/arduino_iot_wifishield).
2. Double click the file to open it in Arduino IDE.
3. Click **OK** on the Moving pop-up window. The file will be added inside a folder with named followed by the file name.

```

## Install MQTT Library (4 Steps)

1. Go to menu, Tools > Manage Libraries ...

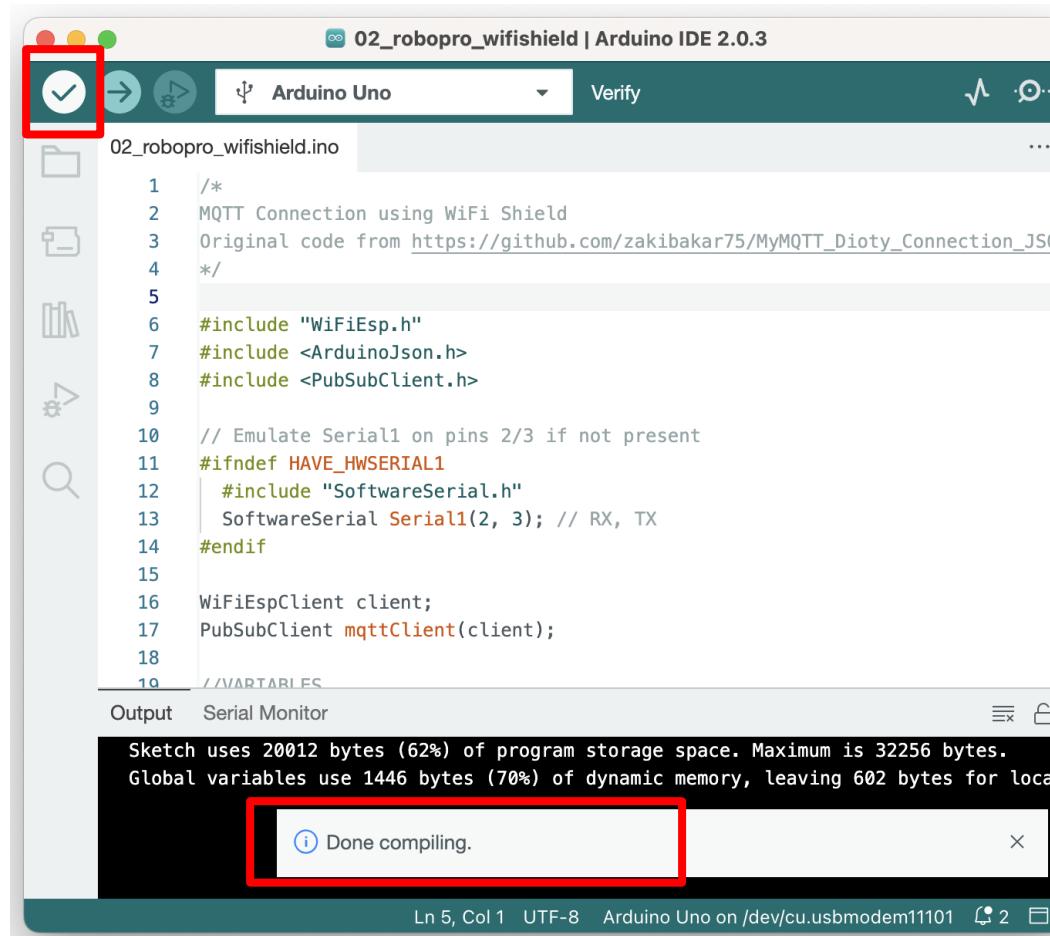

2. On Library Manager window, type in **MQTT** on the field to filter the list of libraries.
3. Click the **Install** button on the MQTT Library and wait until it is done.

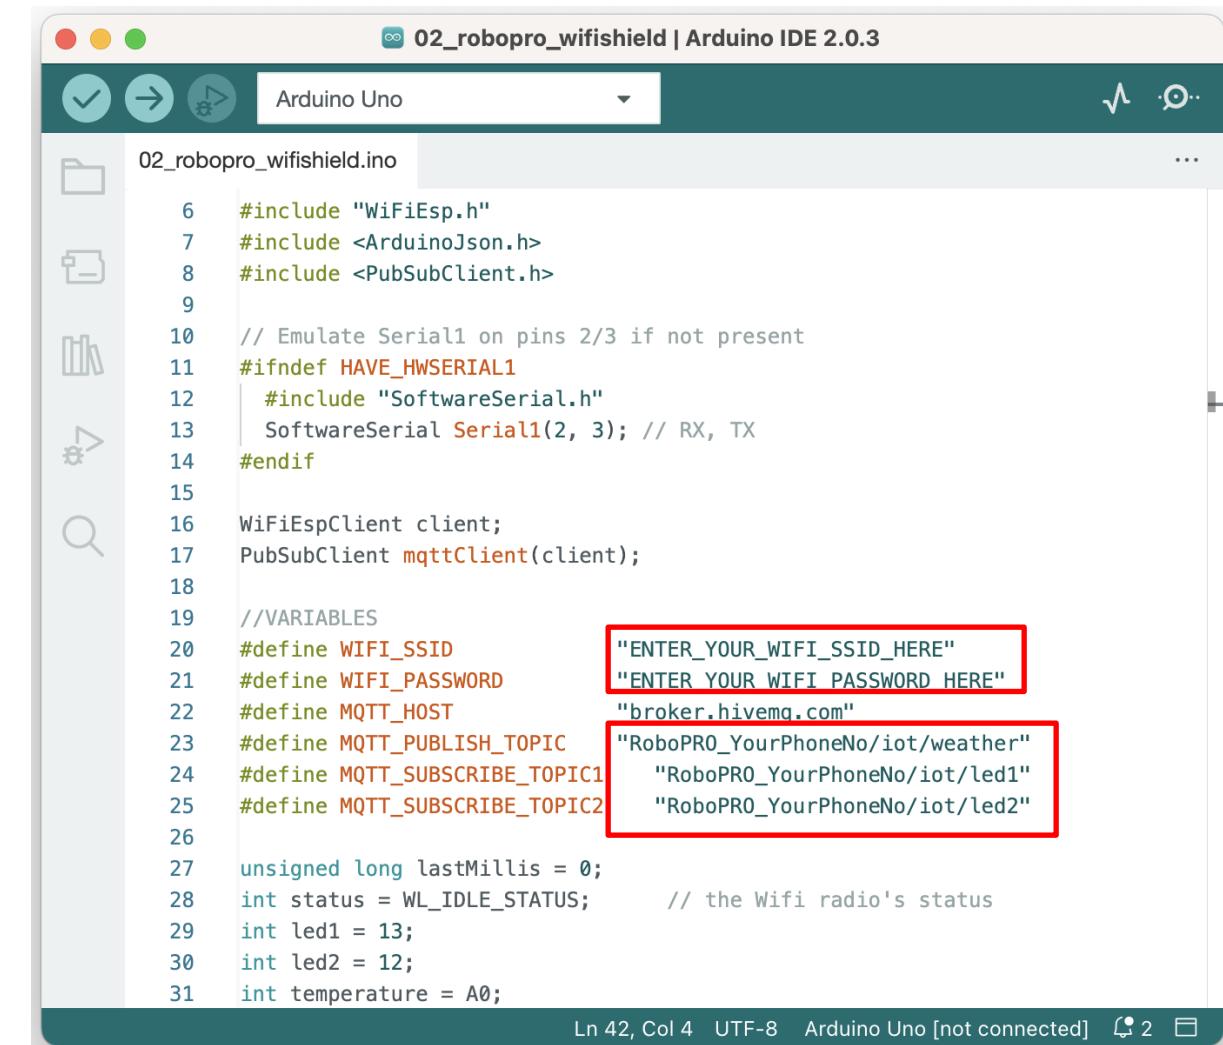

# UNO publish MQTT to Broker

- Click the verify button to compile the example sketch.  
If the status is **Done compiling**, the library installation is successful without error.

## Upload Example Sketch (4 Steps)

1. Replace the **WIFI\_SSID** value to the correct information of your Wi-Fi name.
2. Replace the **WIFI\_PASSWORD** value to the correct information your Wi-Fi password.
3. Replace the **MQTT\_PREFIX\_TOPIC** of mobile number with your own mobile number.
4. Click the **Upload** button to compile and upload the program into the ESP32 microcontroller, wait until the status is **Done uploading**.

```

02_robopro_wifishield.ino

## ARDUINO SKETCH EXPLAIN

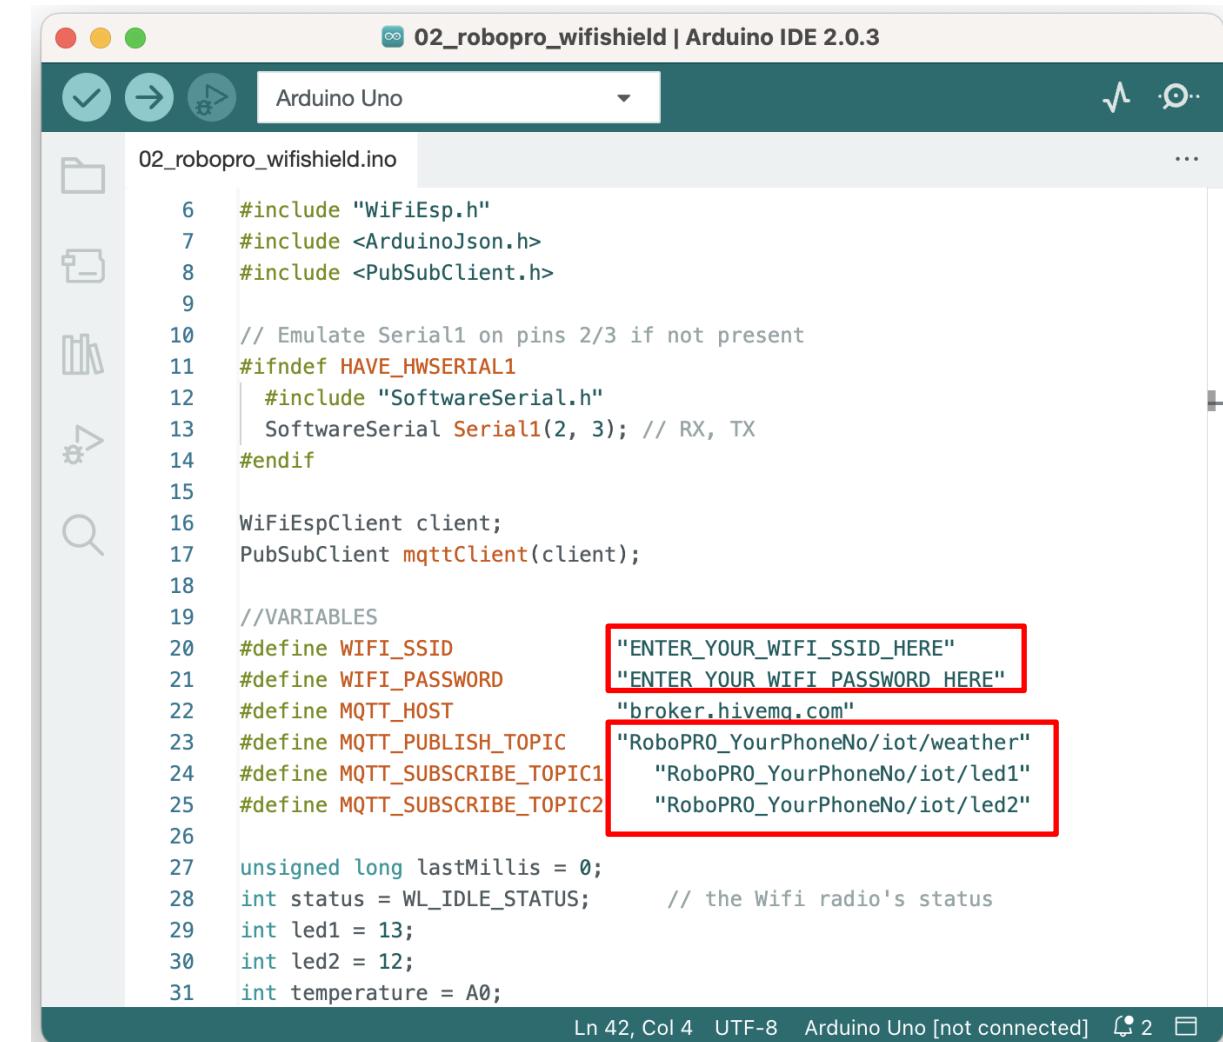

It is a complete program, as sets of function for UNO microcontroller to execute tasks through WiFi ESP8266 shield:

### EXECUTE ONCE

1. Connect to nearest Wi-Fi access point.
2. Connect to public MQTT broker.

### EXECUTE REPEATEDLY

3. Check if ESP8266 Wi-Fi's disconnected to reconnect to the Wi-Fi access point.
4. Check if connection to public MQTT broker disconnected to reconnect.

```

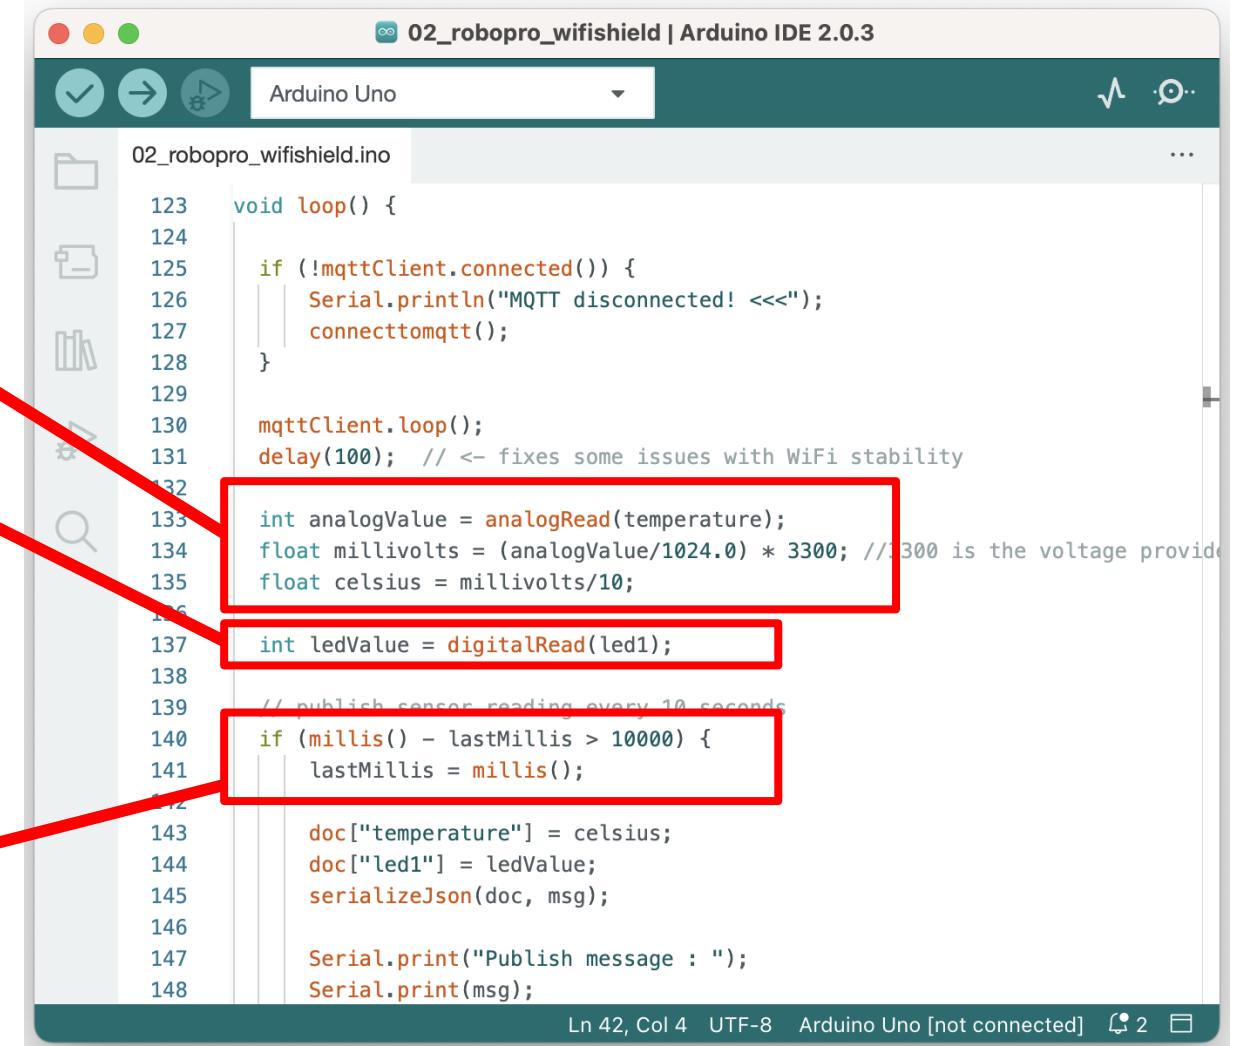

02_robopro_wifishield.ino
6 #include "WiFiEsp.h"
7 #include <ArduinoJson.h>
8 #include <PubSubClient.h>
9
10 // Emulate Serial1 on pins 2/3 if not present
11 #ifndef HAVE_HWSERIAL1
12     #include "SoftwareSerial.h"
13     SoftwareSerial Serial1(2, 3); // RX, TX
14 #endif
15
16 WiFiEspClient client;
17 PubSubClient mqttClient(client);
18
19 //VARIABLES
20 #define WIFI_SSID "ENTER_YOUR_WIFI_SSID_HERE"
21 #define WIFI_PASSWORD "ENTER YOUR WIFI PASSWORD HERE"
22 #define MQTT_HOST "broker.hivemq.com"
23 #define MQTT_PUBLISH_TOPIC "RoboPRO_YourPhoneNo/iot/weather"
24 #define MQTT_SUBSCRIBE_TOPIC1 "RoboPRO_YourPhoneNo/iot/led1"
25 #define MQTT_SUBSCRIBE_TOPIC2 "RoboPRO_YourPhoneNo/iot/led2"
26
27 unsigned long lastMillis = 0;
28 int status = WL_IDLE_STATUS;           // the Wifi radio's status
29 int led1 = 13;
30 int led2 = 12;
31 int temperature = A0;

```

Ln 42, Col 4 UTF-8 Arduino Uno [not connected] ⌂ 2

# UNO publish MQTT to Broker

5. Read LM35 sensor value:
  - Temperature, °C
6. Read LED1 pin value
7. Print the sensor's value and LED1 pin values on the Serial Monitor.
8. Create JSON format data from the sensor's value to send to the Node-RED over MQTT protocol.
9. The JSON format data is publish to MQTT topic by 10 seconds interval.

The screenshot shows the Arduino IDE 2.0.3 interface with the sketch file `02_robopro_wifishield.ino` open. The code is as follows:

```

void loop() {
  if (!mqttClient.connected()) {
    Serial.println("MQTT disconnected! <<<");
    connecttomqtt();
  }

  mqttClient.loop();
  delay(100); // <- fixes some issues with WiFi stability

  int analogValue = analogRead(temperature);
  float millivolts = (analogValue/1024.0) * 3300; // 3300 is the voltage provided by the LM35
  float celsius = millivolts/10;

  int ledValue = digitalRead(led1);

  // publish sensor reading every 10 seconds
  if (millis() - lastMillis > 10000) {
    lastMillis = millis();

    doc["temperature"] = celsius;
    doc["led1"] = ledValue;
    serializeJson(doc, msg);

    Serial.print("Publish message : ");
    Serial.print(msg);
  }
}

```

Red arrows point from the numbered steps in the list to specific parts of the code in the IDE. Step 5 points to the line `int analogValue = analogRead(temperature);`. Step 6 points to the line `int ledValue = digitalRead(led1);`. Step 9 points to the line `Serial.print("Publish message : ");`.

# UNO publish MQTT to Broker

The result of **Step No. 7** on the Serial Monitor as shown in the image below.

Output    Serial Monitor X

Message (Enter to send message to 'Arduino Uno' on '/dev/cu.u')    New Line    115200 baud

```

Publish to : RoboPRO_012345678/iot/weather
Publish message : {"temperature":155.332,"led1":0}
Publish to : RoboPRO_012345678/iot/weather
Publish message : {"temperature":94.10156,"led1":0}
Publish to : RoboPRO_012345678/iot/weather
Publish message : {"temperature":94.74609,"led1":0}

```

Ln 52, Col 50    UTF-8    Arduino Uno on /dev/cu.usbmodem11101    2

## What is JSON?

- JSON (JavaScript Object Notation).
- Lightweight format for storing and transporting data.
- JSON syntax rules:
  - Data is in name/value pairs
  - Data is separated by commas
  - Curly braces hold objects
  - Square brackets hold arrays
- "Self-describing" as it has key and value in pair, better than unexplainable plain text.

31

### Plain Text

No description or no meaning data

{ "age": 31 }

### JSON

Self describe value, with helps of the pair of key and value

## JSON for Sensor's Data

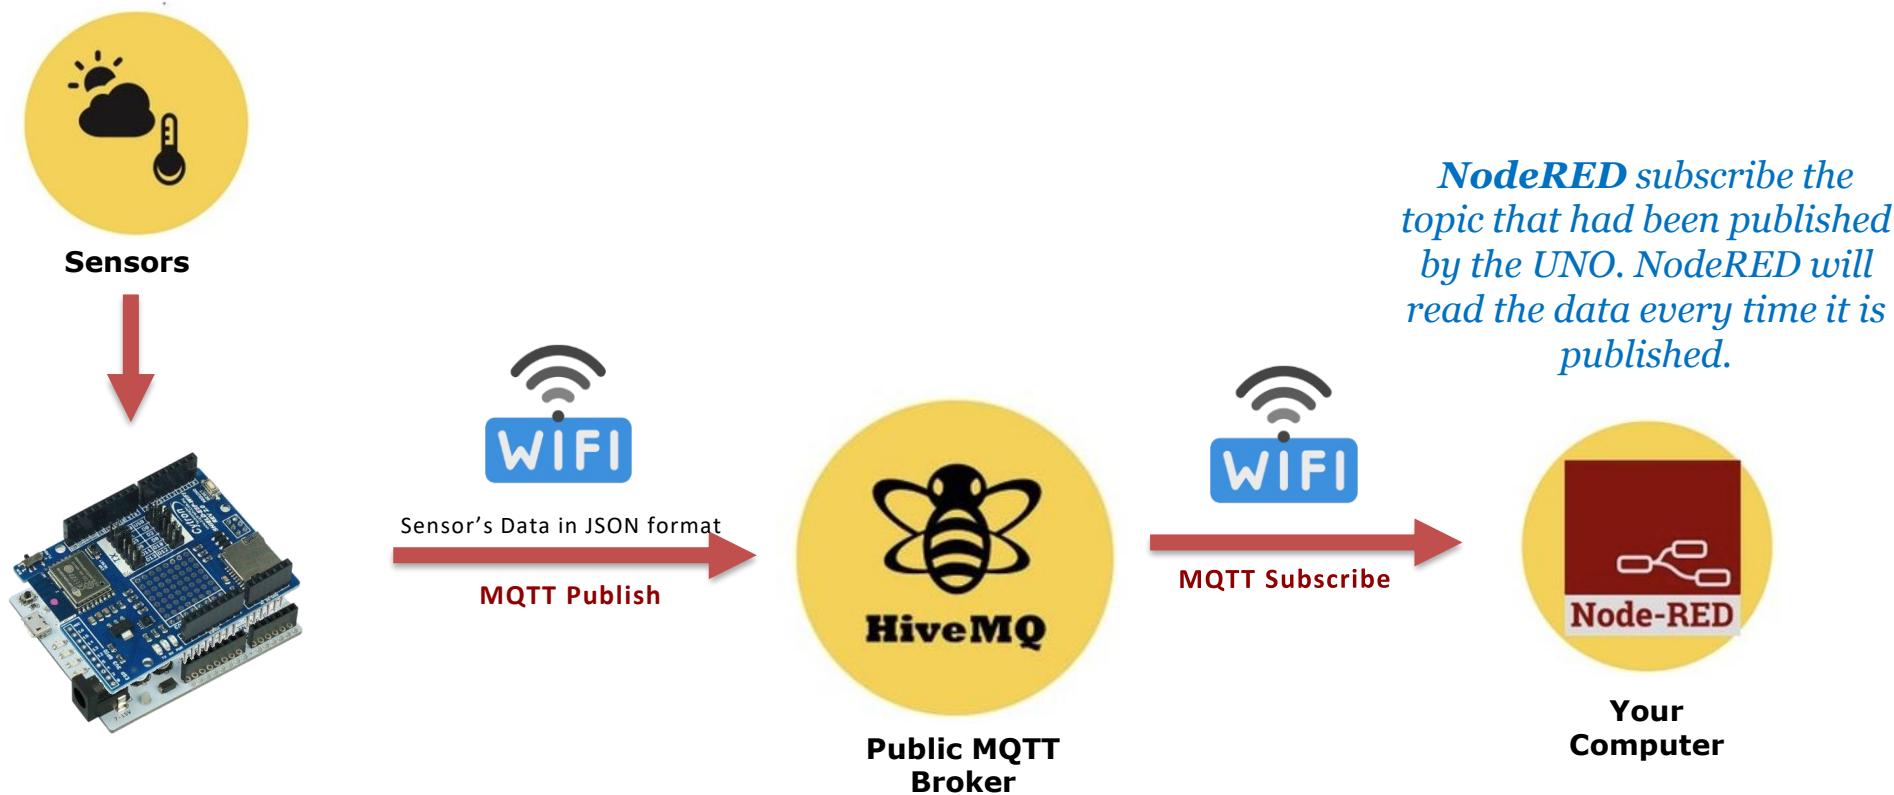

- Sending the sensor's data to the cloud in JSON format is better than only plain text.
- UNO read LM35 sensor and LED1 data and format them in JSON format as below.

```
{  
  "temperature": 28.17,  
  "led1": 0  
}
```

- The data is self-described and easy to access the value from the object, just call the key. For example, call temperature key, will give the result of 28.17.
- The JSON key calling method is applicable on any system, including Node-RED.

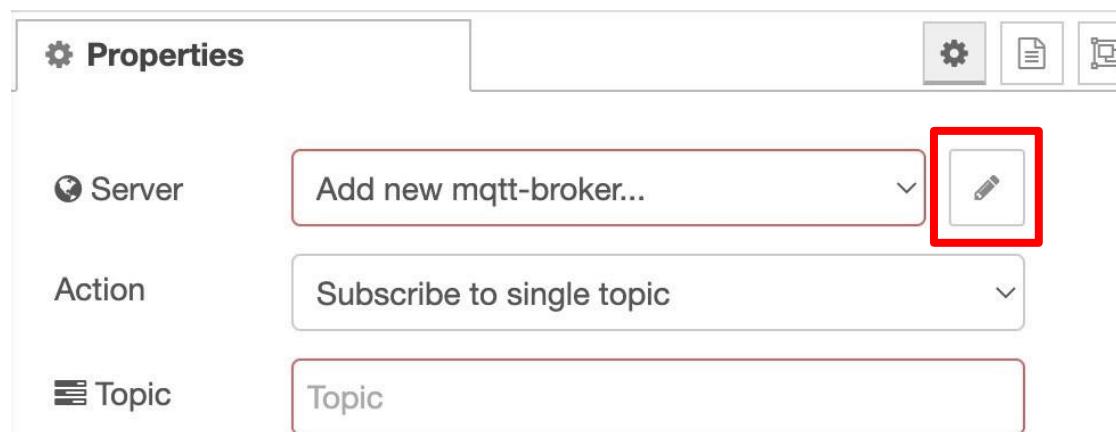

The connectivity of UNO and Node-RED is via HiveMQ public MQTT broker.

## The architecture:

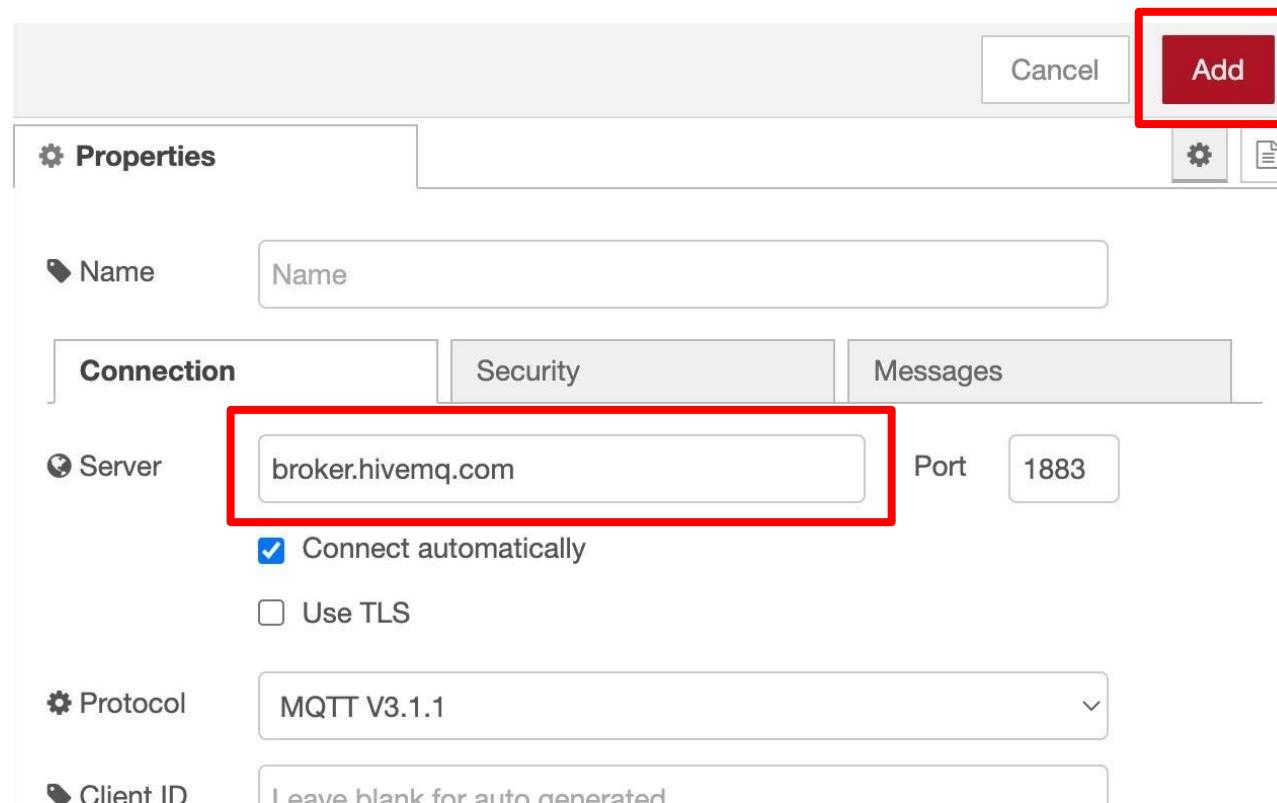

## Node-RED Receive JSON Data from UNO (10 Steps)

1. Insert **mqtt in** node into the workspace.
2. Double click the node to edit the properties.
3. Add new MQTT broker setup by clicking the pencil icon.

4. Type in **broker.hivemq.com** to the **Server** field.
5. Left others configuration as default.
6. Click the **Add** button to confirm adding the MQTT broker.

- Set MQTT topic to provided MQTT topic by UNO, from the Serial Monitor.

Output    Serial Monitor X

Message (Enter to send message to 'Arduino Uno' on '/dev/cu.u')  
 New Line    115200 baud

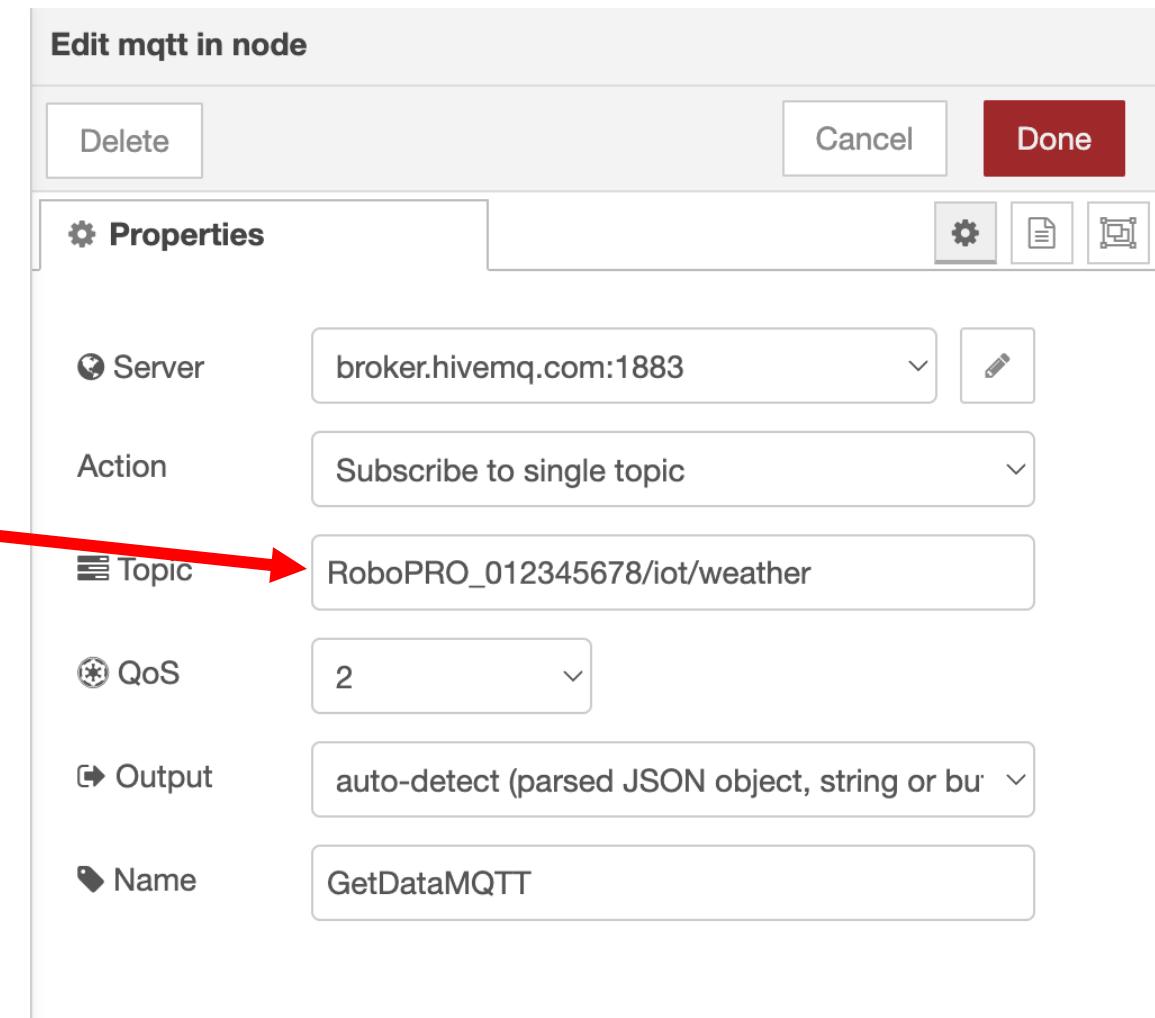

```

Publish to : RoboPRO_012345678/iot/weather
Publish message : {"temperature":155.332,"led1":0}
Publish to : RoboPRO_012345678/iot/weather
Publish message : {"temperature":94.10156,"led1":0}
Publish to : RoboPRO_012345678/iot/weather
Publish message : {"temperature":94.74609,"led1":0}

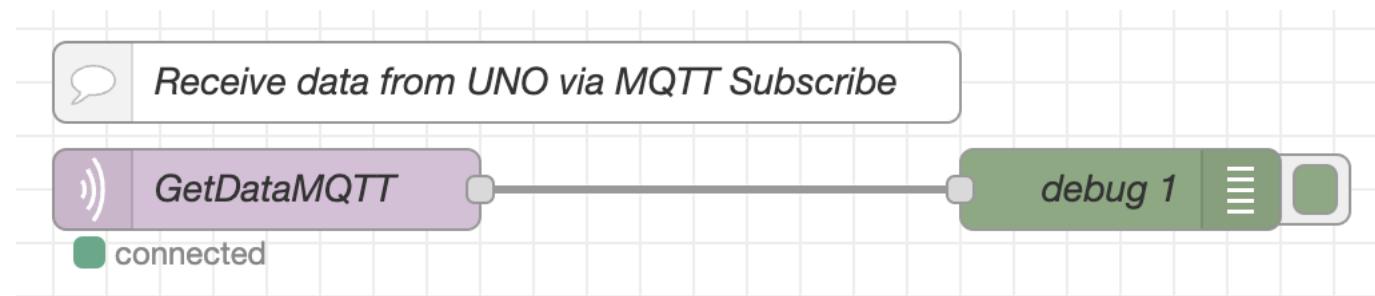

```

Ln 52, Col 50    UTF-8    Arduino Uno on /dev/cu.usbmodem11101

- The Name of the node is **GetDataMQTT**
- Left other configurations as default.
- Click the **Done** button to confirm the **mqtt in** node properties configuration.

- Insert **debug** node into the workspace and connect with **mqtt in** node.

- Click the **Deploy** button to redeploy the flow.
- Observe the incoming JSON payload on the Node-RED's debug sidebar from the MQTT topic published by UNO, where the time interval is **10 seconds**.

**10 seconds Interval**

```

28/12/2022 13:45:54 node: debug
RoboPRO_012345678/iot/weather : msg.payload : Object
▶ { temperature: 29.97, led1: 0 }

28/12/2022 13:46:04 node: debug 3
RoboPRO_012345678/iot/weather : msg.payload : Object
▶ { temperature: 29.33, led1: 0 }

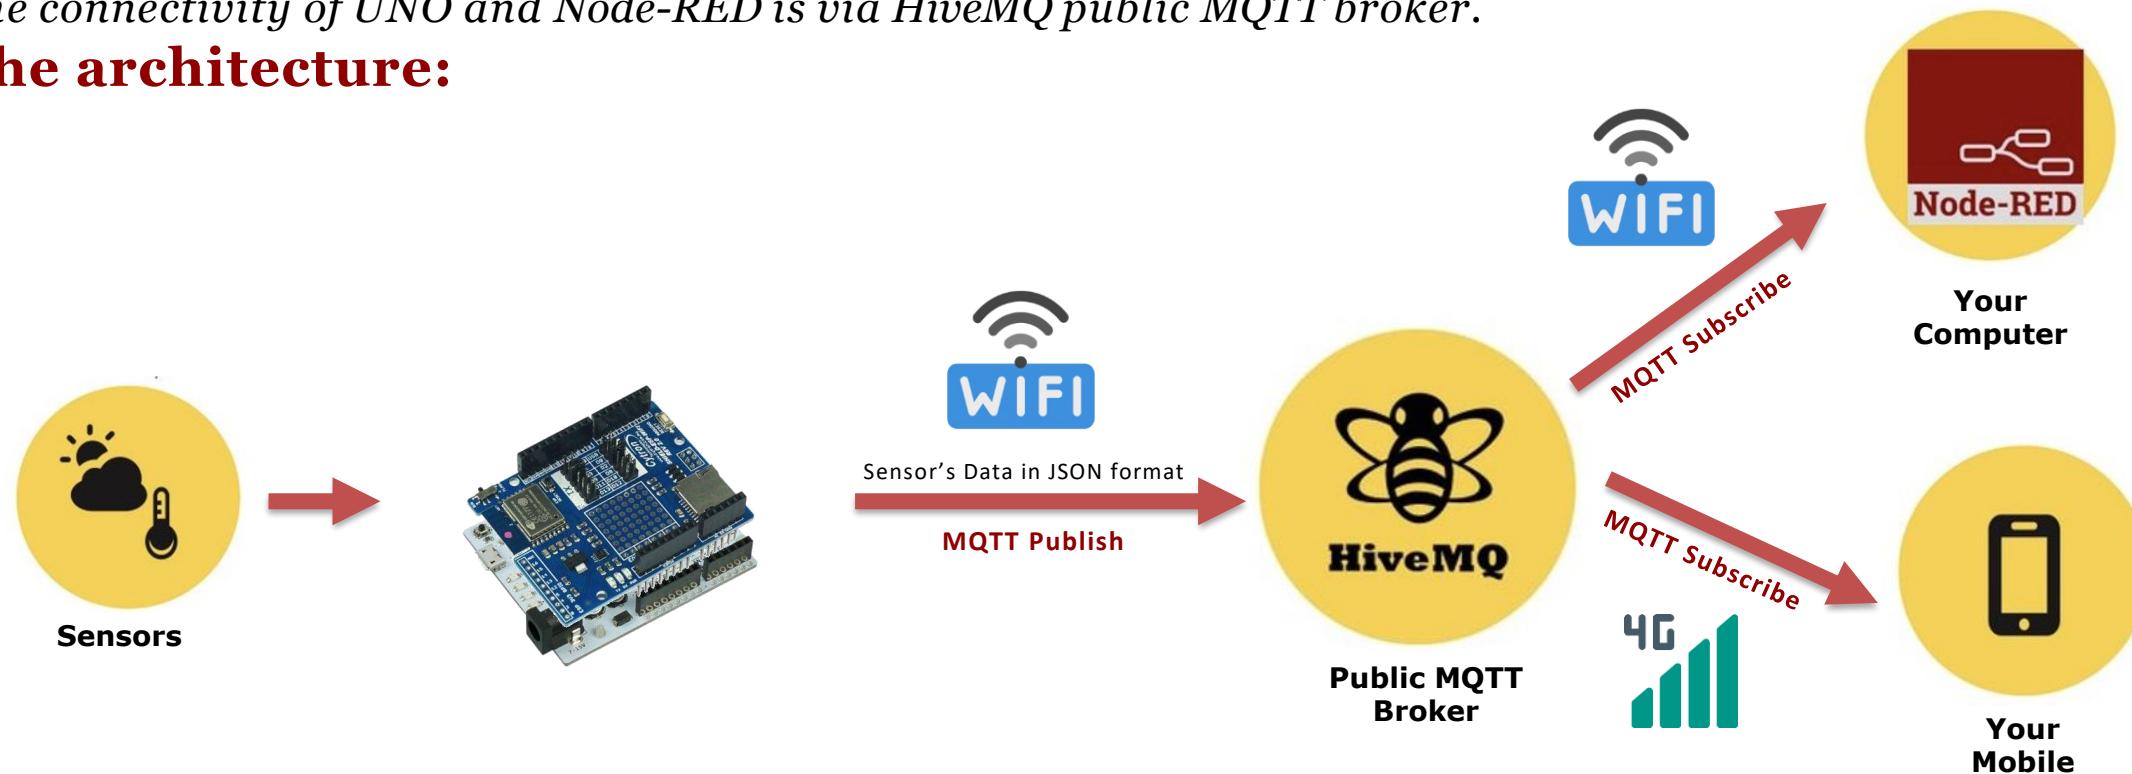

28/12/2022 13:46:15 node: debug 3
RoboPRO_012345678/iot/weather : msg.payload : Object
▶ { temperature: 29.33, led1: 0 }

28/12/2022 13:46:24 node: debug 3
RoboPRO_012345678/iot/weather : msg.payload : Object
▶ { temperature: 29.65, led1: 0 }

```

*The connectivity of UNO and Node-RED is via HiveMQ public MQTT broker.*

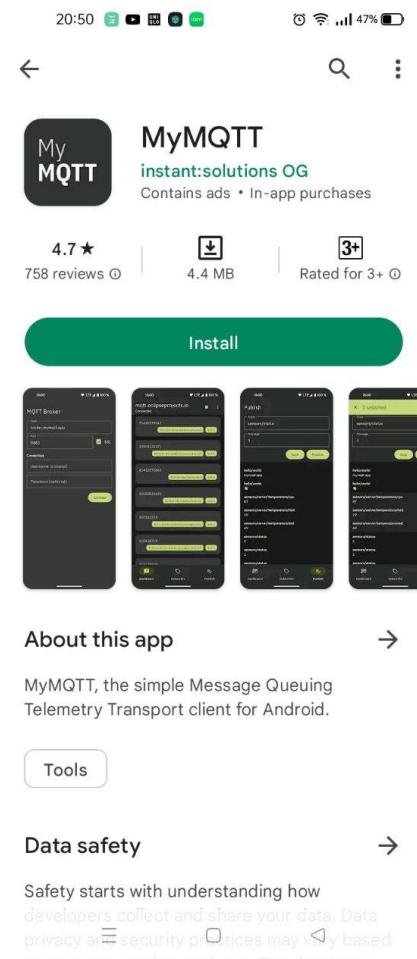

## The architecture:

**Mobile Apps** subscribe the topic that had been published by the UNO. The apps will read the data every time it is published.

## Setup MQTT Client Apps on Mobile Phone (6 steps)

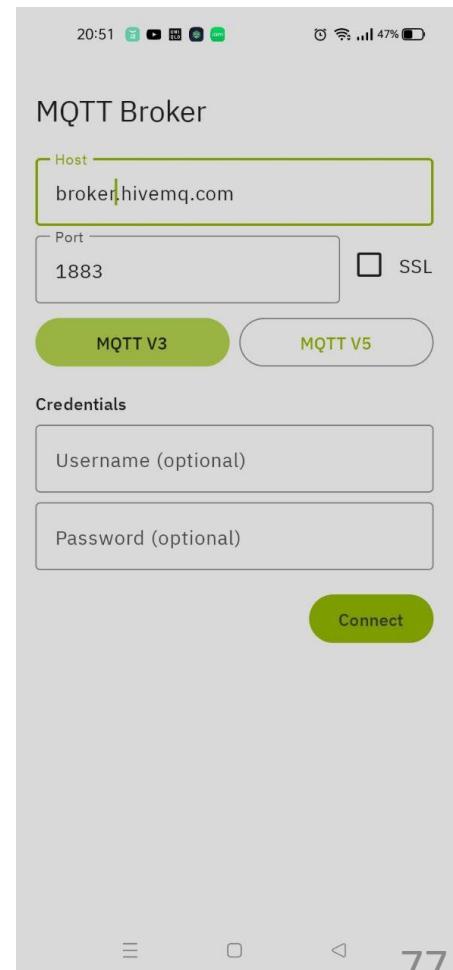

1. Download **MyMQTT** Apps from Google Play or Apple Store

2. Setup the Broker connection:

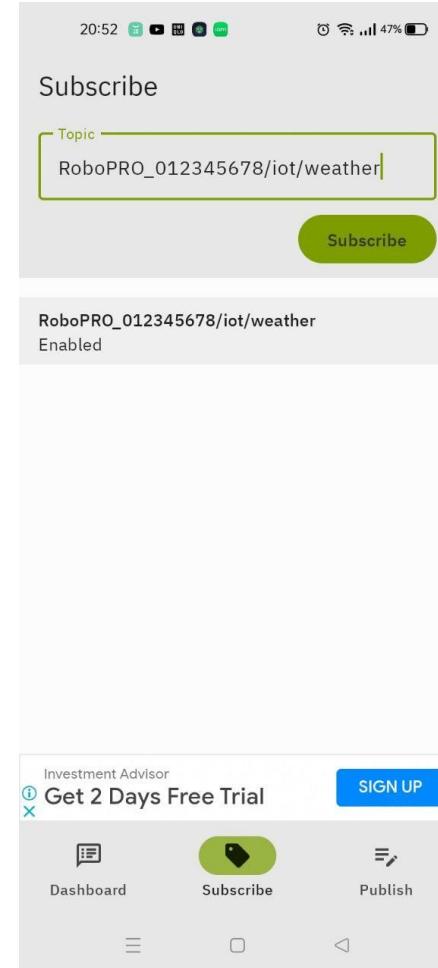

- **Host:** broker.hivemq.com
- **Port:** 1883
- **Protocol:** MQTT V3

3. Click **Connect** to connect to the broker server

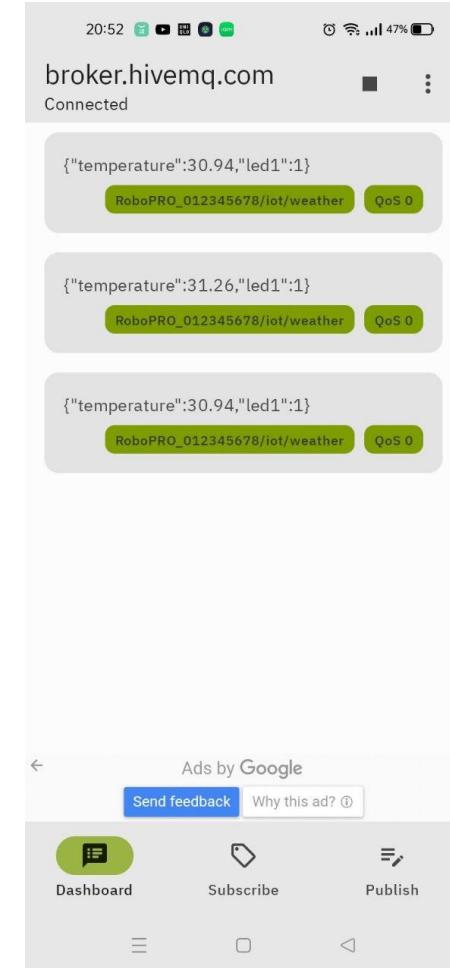

4. Enter your **subscribe topic** as stated in your Arduino Sketch.

5. Click **Subscribe**.

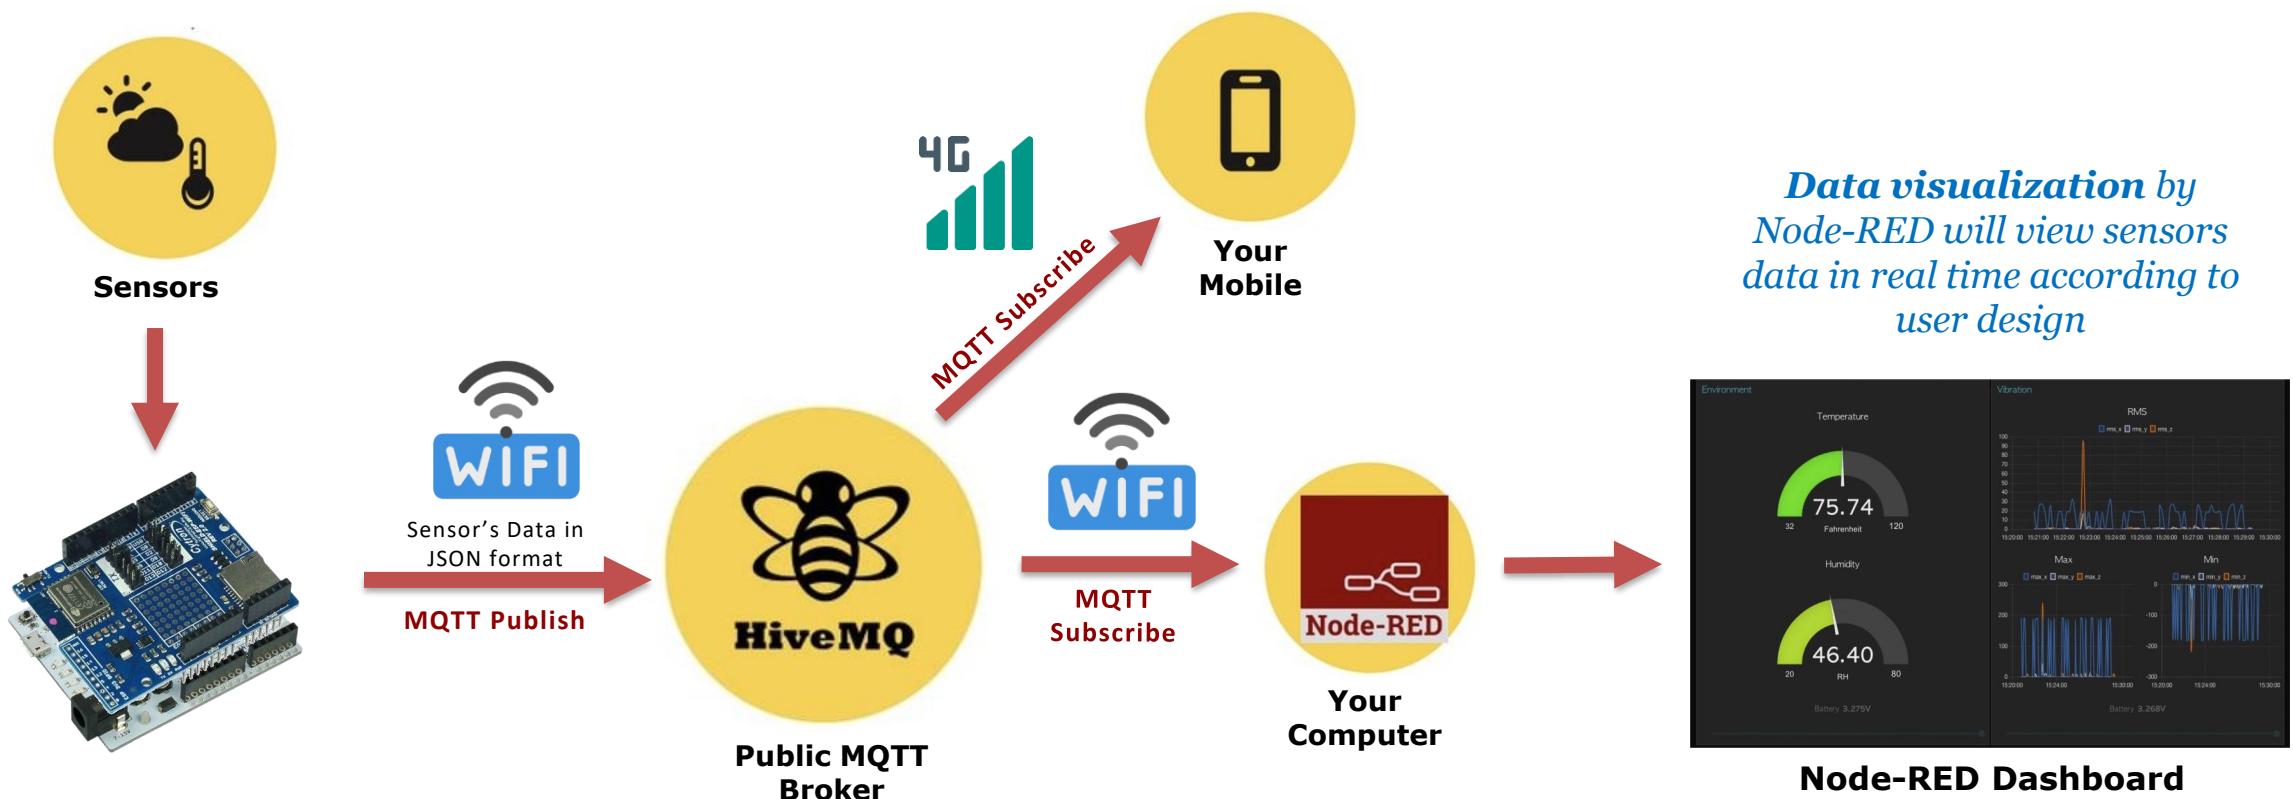

6. Click **Dashboard**. You should receive sensors data every time it is published by the UNO.

The connectivity of UNO and Node-RED is via HiveMQ public MQTT broker.

## The architecture:

## Integrate the JSON Payload Data to the Node-RED Dashboard Nodes.

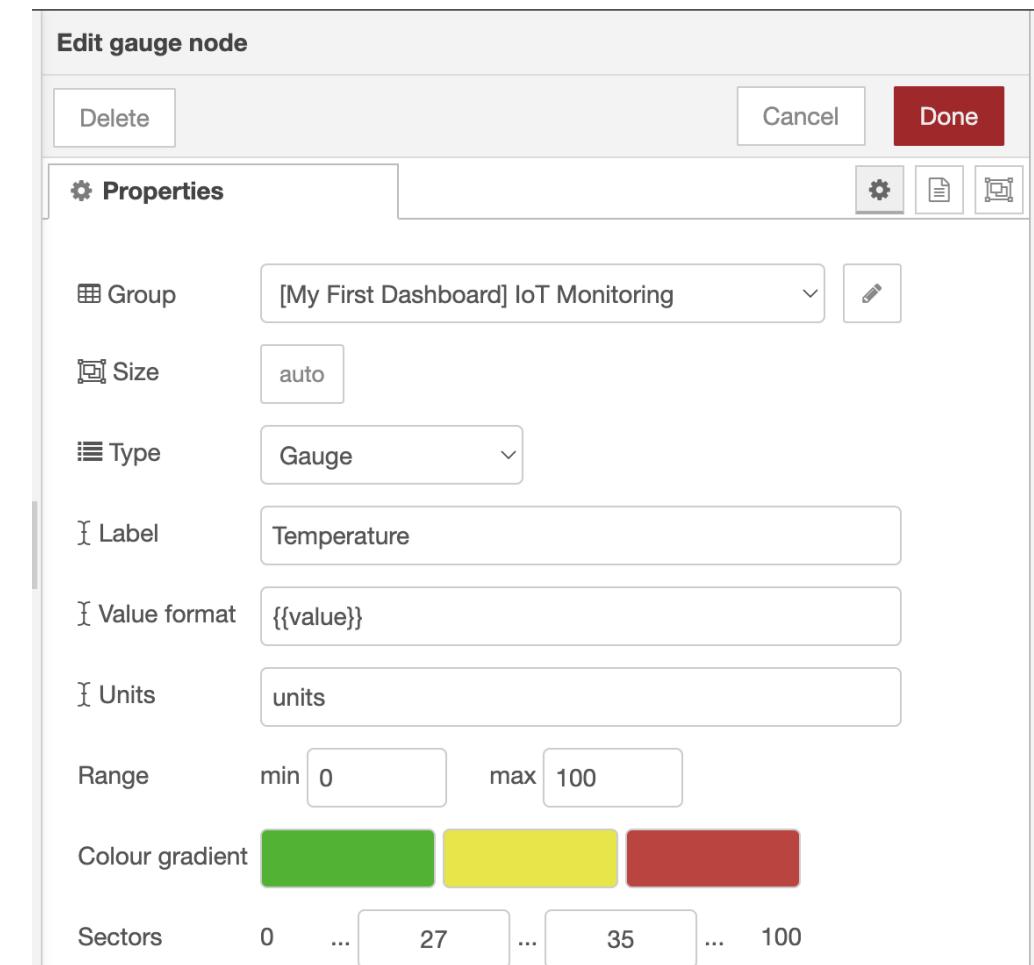

- Below is the example of incoming JSON payload into Node-RED **mqtt in** node.

```
{  
  "temperature":29.33,  
  "led1":0  
}
```

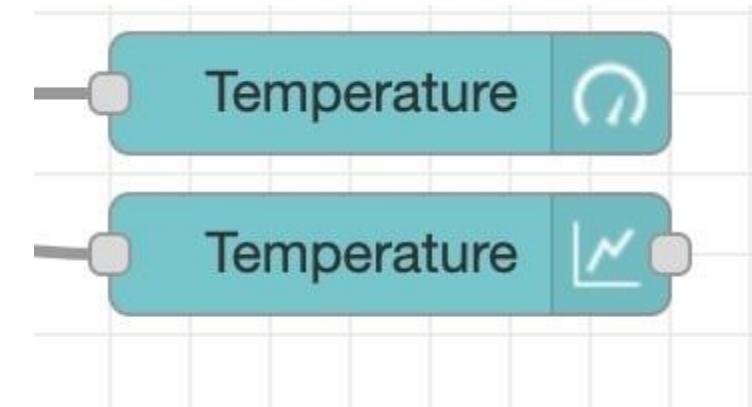

- It is an object, with 2 JSON keys, **temperature** and **led1**.
- In Node-RED the right way to get the value of **temperature** is to called the variable with complete message object, for example **msg.payload.temperature** will return 28.17.
- While **msg.payload.led1** will return 0

- Insert **gauge** and **chart** node into the workspace.
- Double click the **gauge** node to edit the properties.
- The Label is “**Temperature**”. Leave other values as default.
- Select the existing group (that you had created before) – eg. *[My First Dashboard] IoT Monitoring*
- Click Done.

- Double click the **chart** node to edit the properties.
  - The Label is “**Temperature**”.
  - Select the existing group (that you had created before) –  
eg. *[My First Dashboard] IoT Monitoring*
  - Click Done.
- 
- The **gauge** and **chart** node require value from **msg.payload** object **only**, therefore it is not able to read the value from **msg.payload.temperature** object.
  - So, we need to set the value from **msg.payload.temperature** object to **msg.payload** object, then the node are able to read the value correctly.

- To do so, we can use **change** node to do the job.

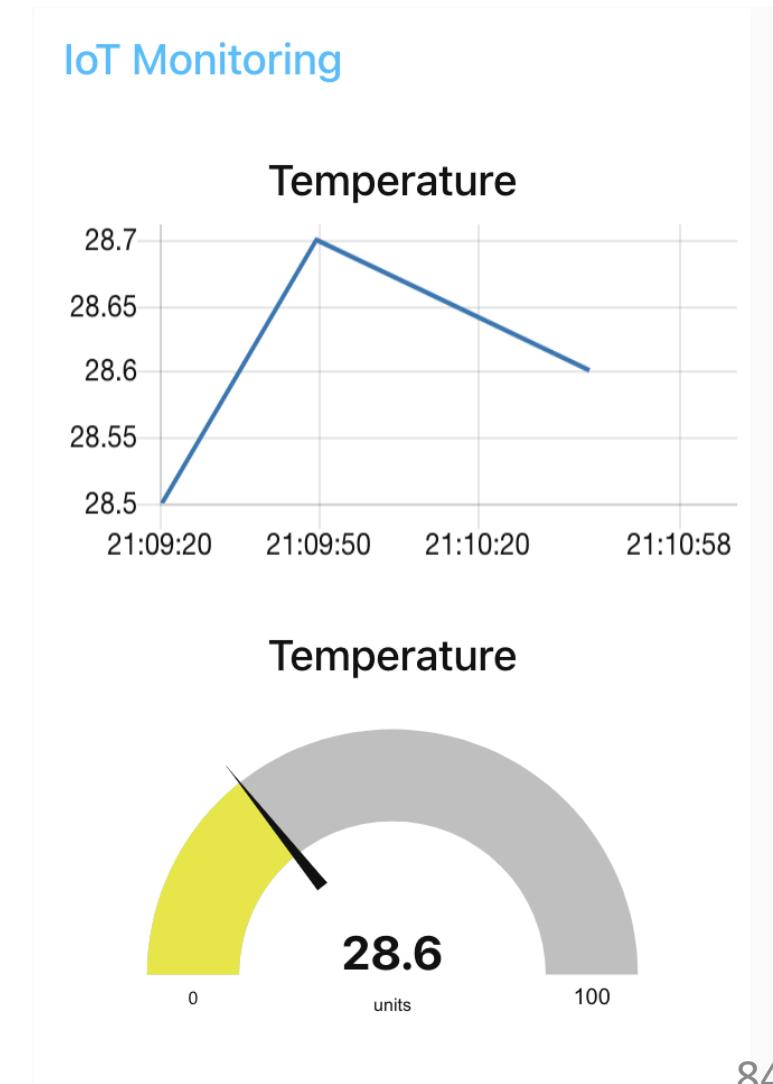

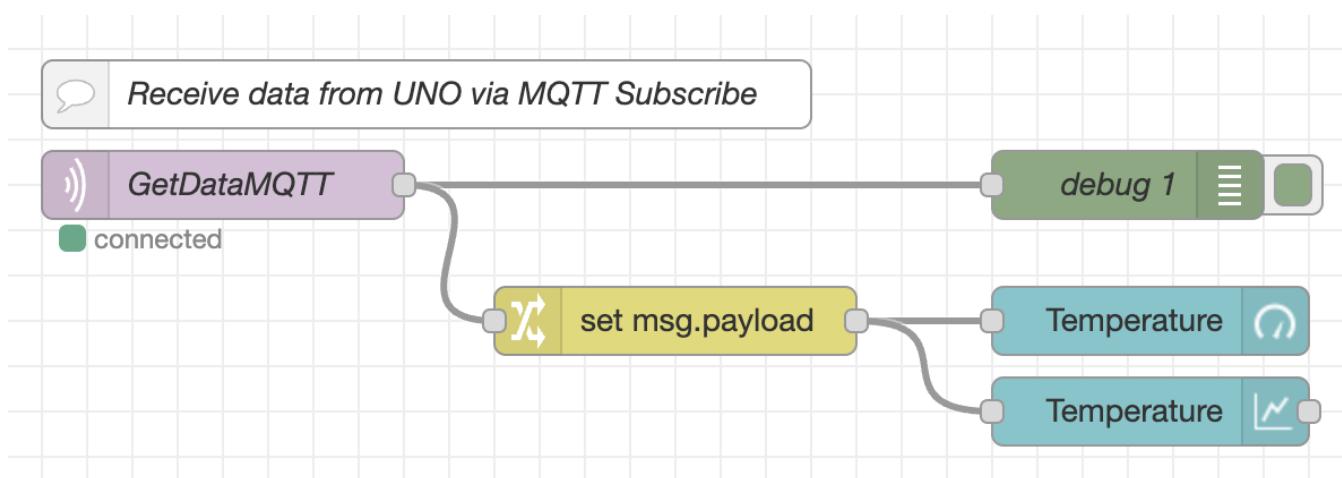

## Set msg.payload Value from the msg.payload.temperature (5 Steps)

- Insert **change** node into the workspace.
- Double click the node to setup the conversion properties.
- Set the **msg.payload** to the value of **msg.payload.temperature** and click the **Done** button.

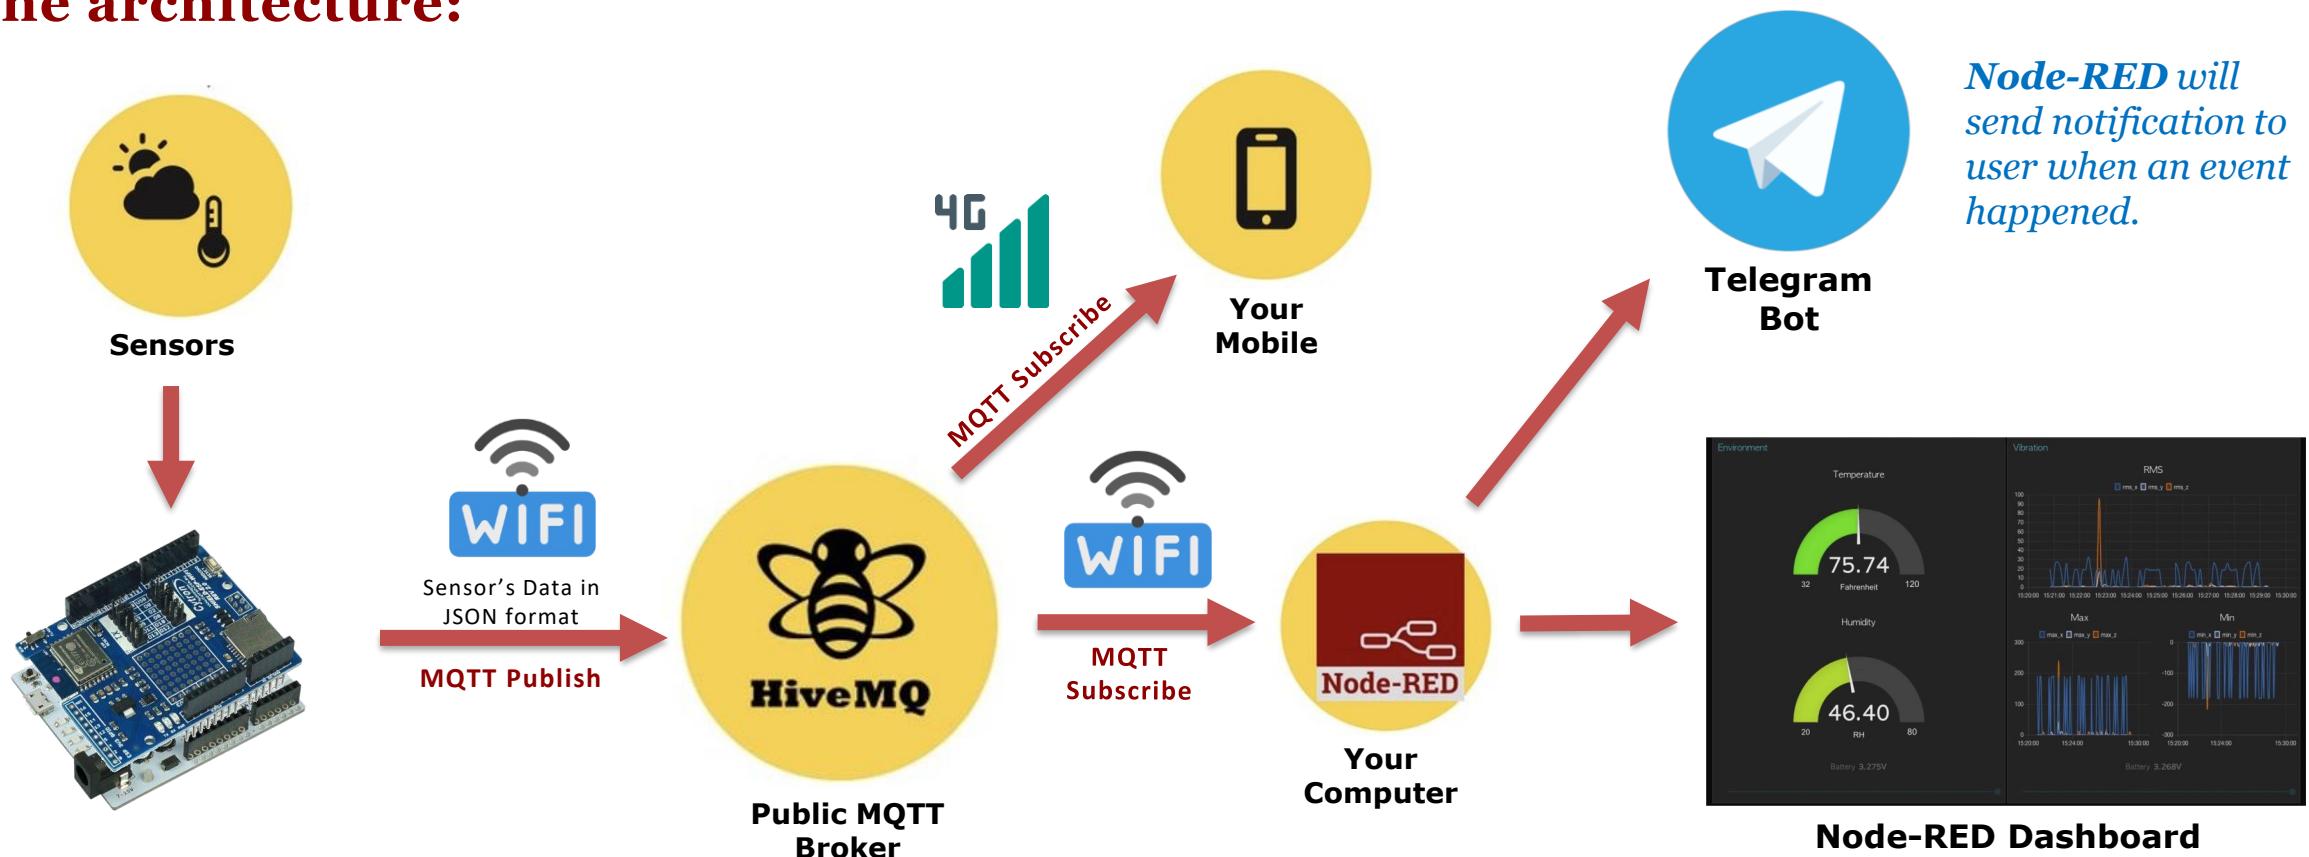

4. Wire them together and redeployed the flow.
5. View the dashboard to see real-time widget changing value depending on the interval of MQTT publish from the UNO.

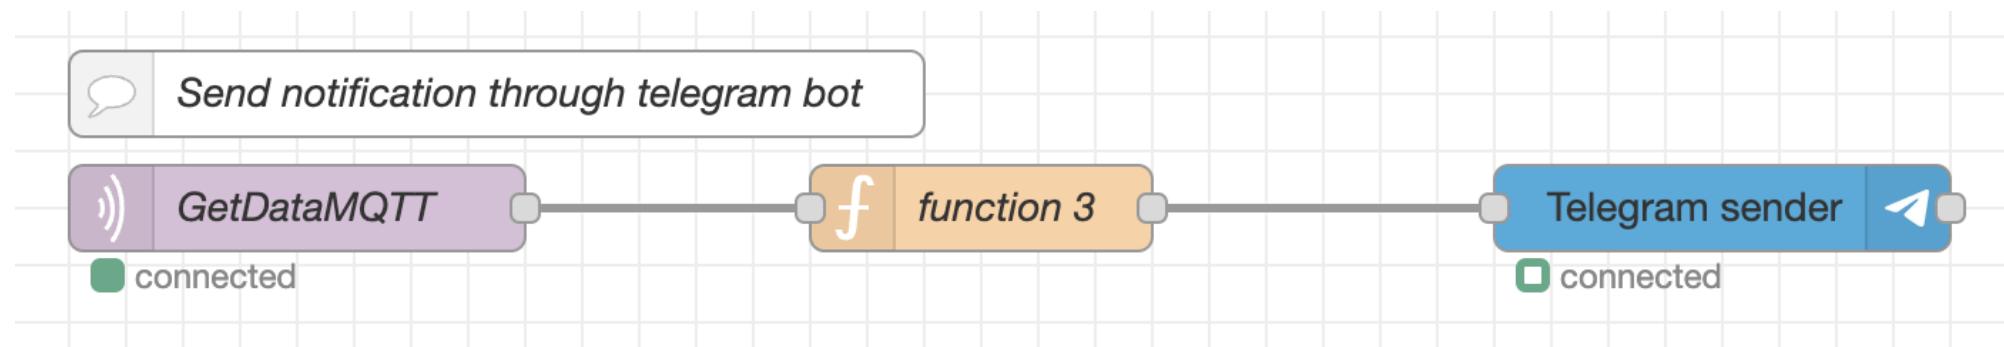

The connectivity of UNO and Node-RED is via HiveMQ public MQTT broker.

## The architecture:

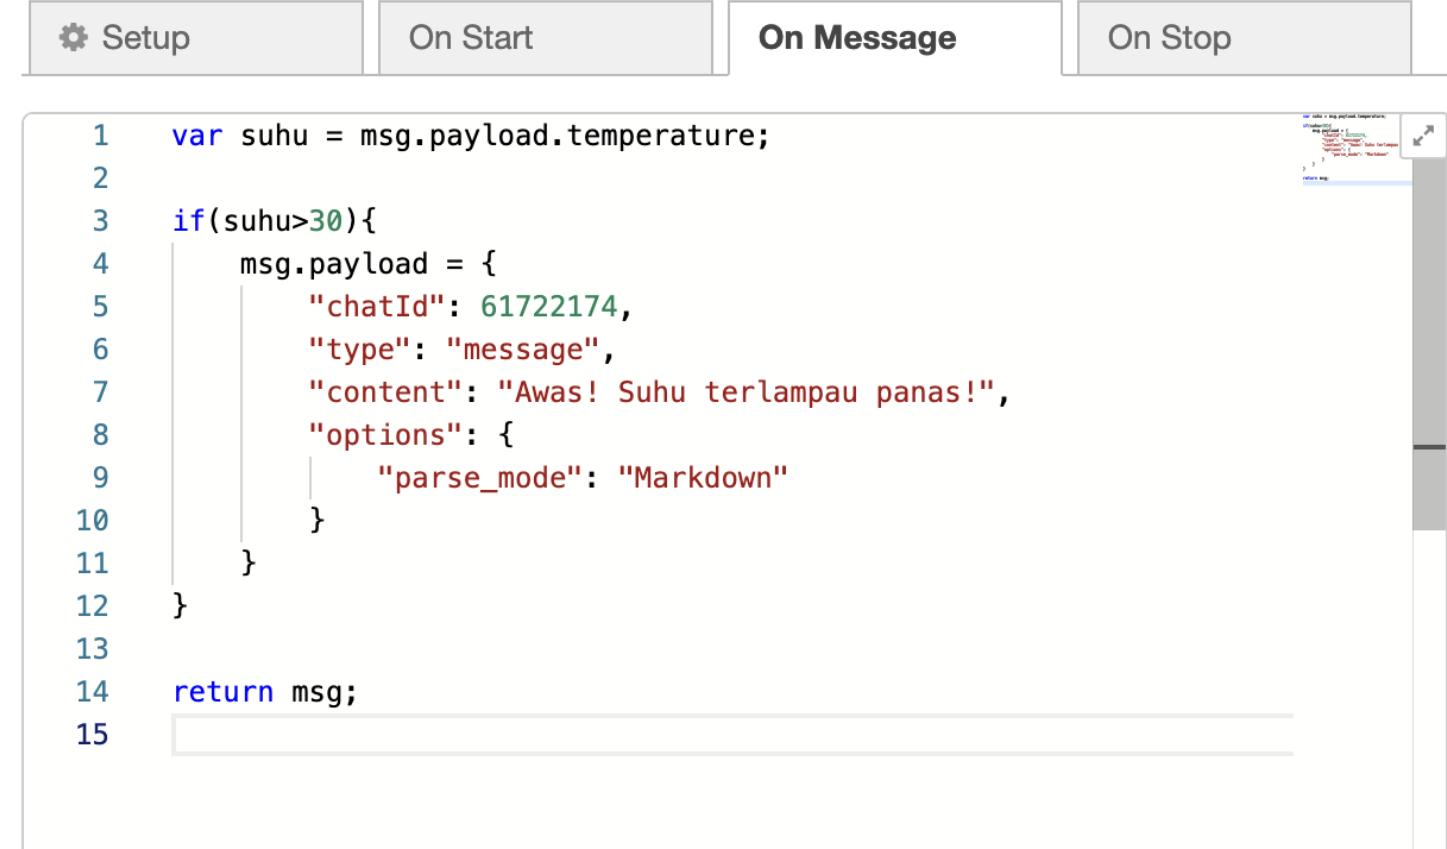

## Real-Time Data Alert Notification to Telegram (8 Steps)

1. Copy the **mqtt in** node **GetDataMQTT** from the previous lesson and paste the node in the workspace .
2. Insert a **function** node and a **Telegram sender** node and wire them together.

3. Double click the **function** node to setup to the Telegram notification based on specific threshold value. For example, trigger an alert when temperature's value is above 30.

4. Create a variable named **suhu** and its value equivalent to JSON object from **mqtt in** node **msg.payload.temperature**.
5. The previous Telegram configurations will only be executed if the suhu value is more than 30, with message of **Awas!**

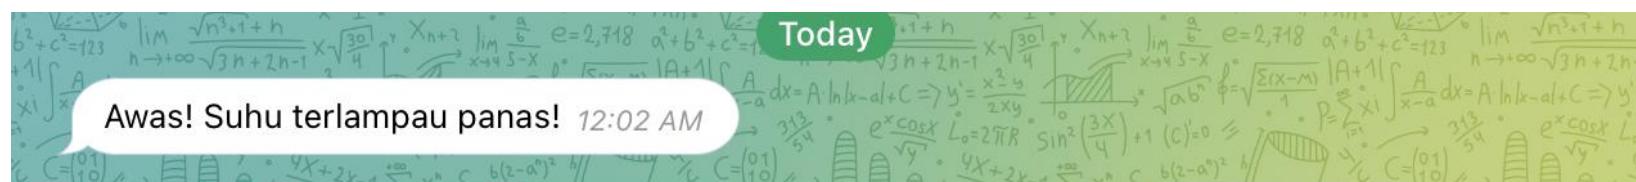

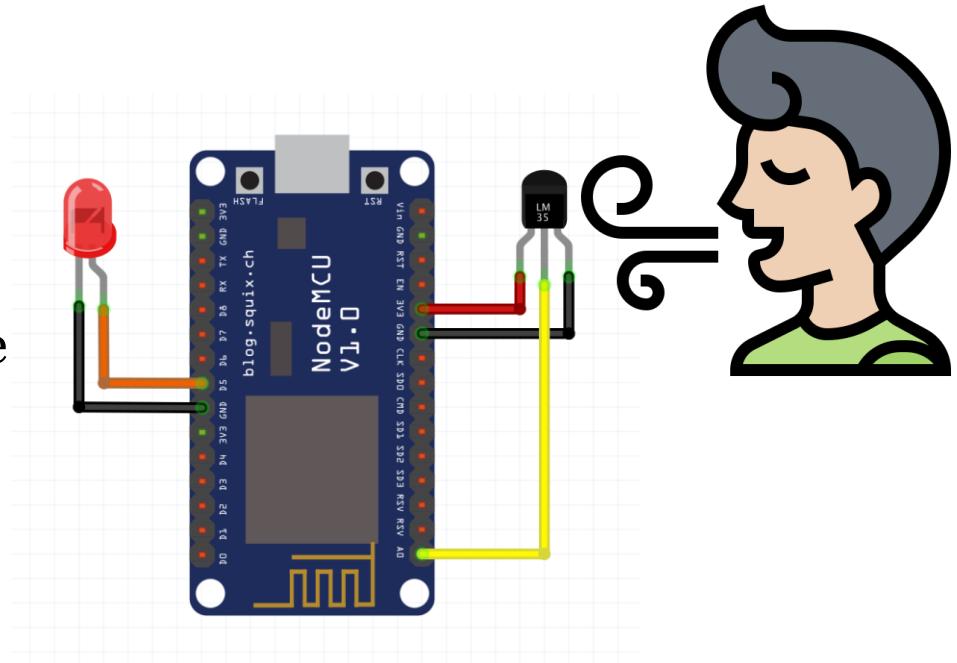

```

1  var suhu = msg.payload.temperature;
2
3  if(suhu>30){
4      msg.payload = {
5          "chatId": 61722174,
6          "type": "message",
7          "content": "Awas! Suhu terlampau panas!",
8          "options": {
9              "parse_mode": "Markdown"
10         }
11     }
12 }
13
14 return msg;
15

```

6. Click the **Done** button and redeploy the flow.
7. Provide high value of temperature by using your breathe pointing on the LM35 sensor on the UNO.
8. Check Telegram alert notification receive when the temperature's value above 30.

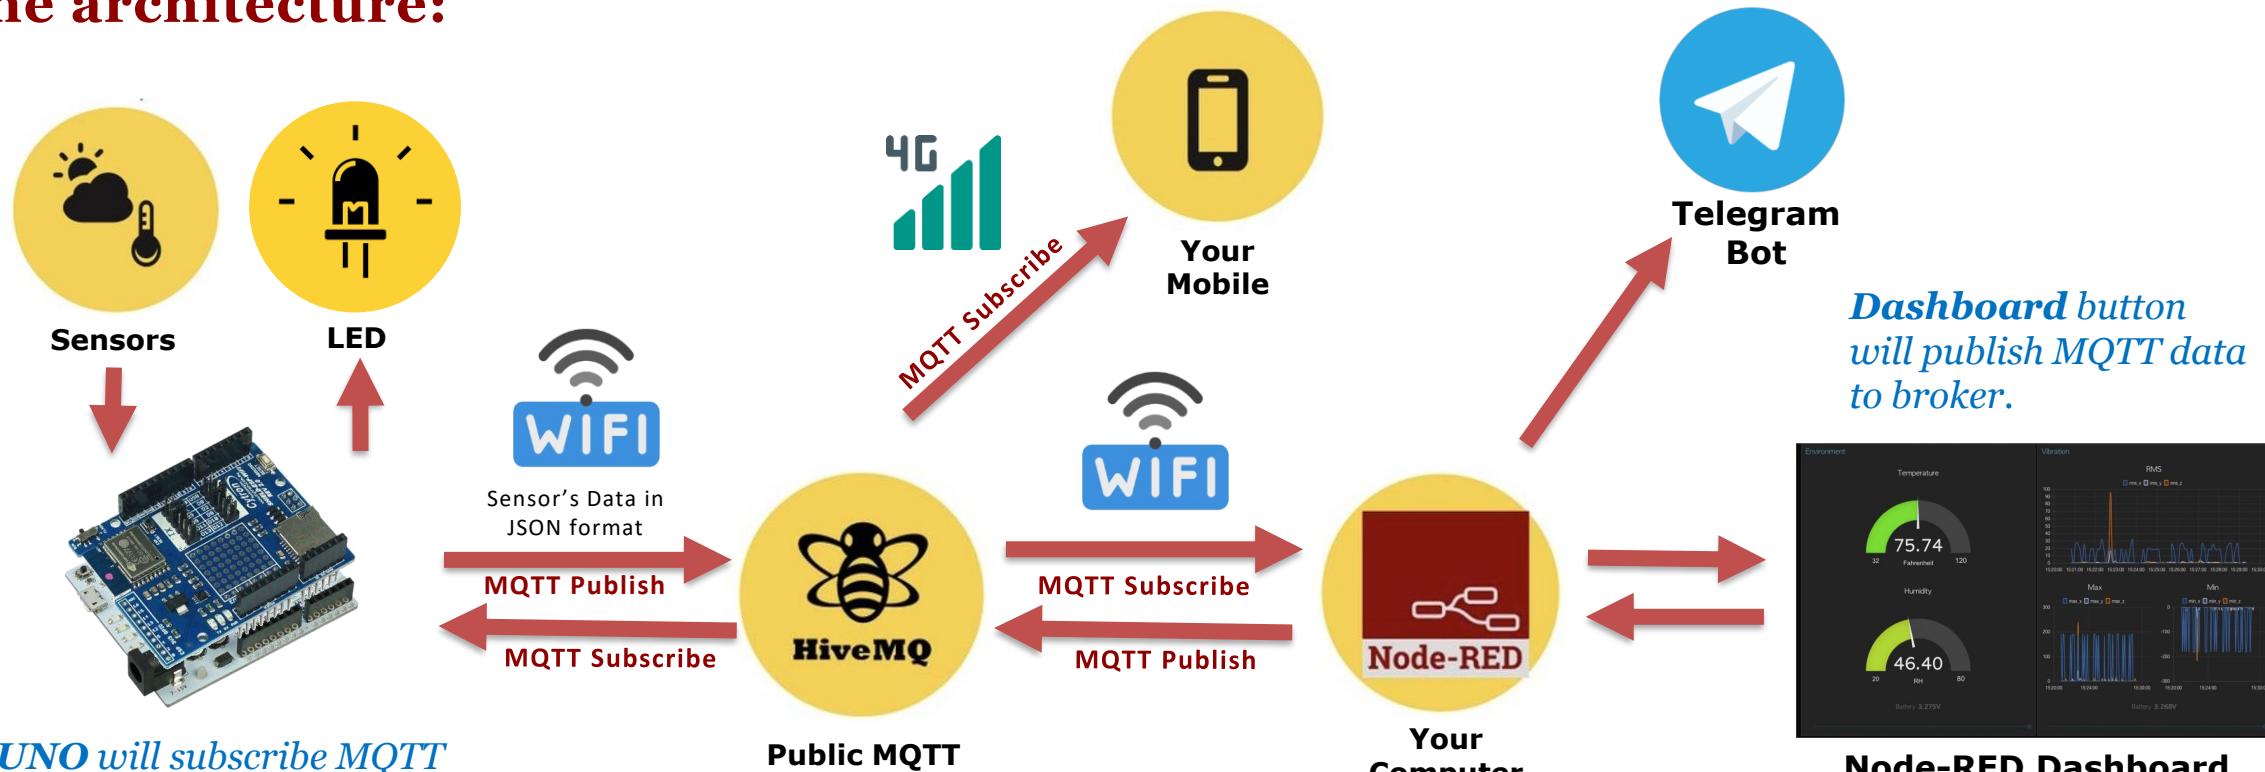

Write a message...

*The connectivity of UNO and Node-RED is via HiveMQ public MQTT broker.*

## The architecture:

*UNO will subscribe MQTT from broker and the LED will behave accordingly every time dashboard publish data.*

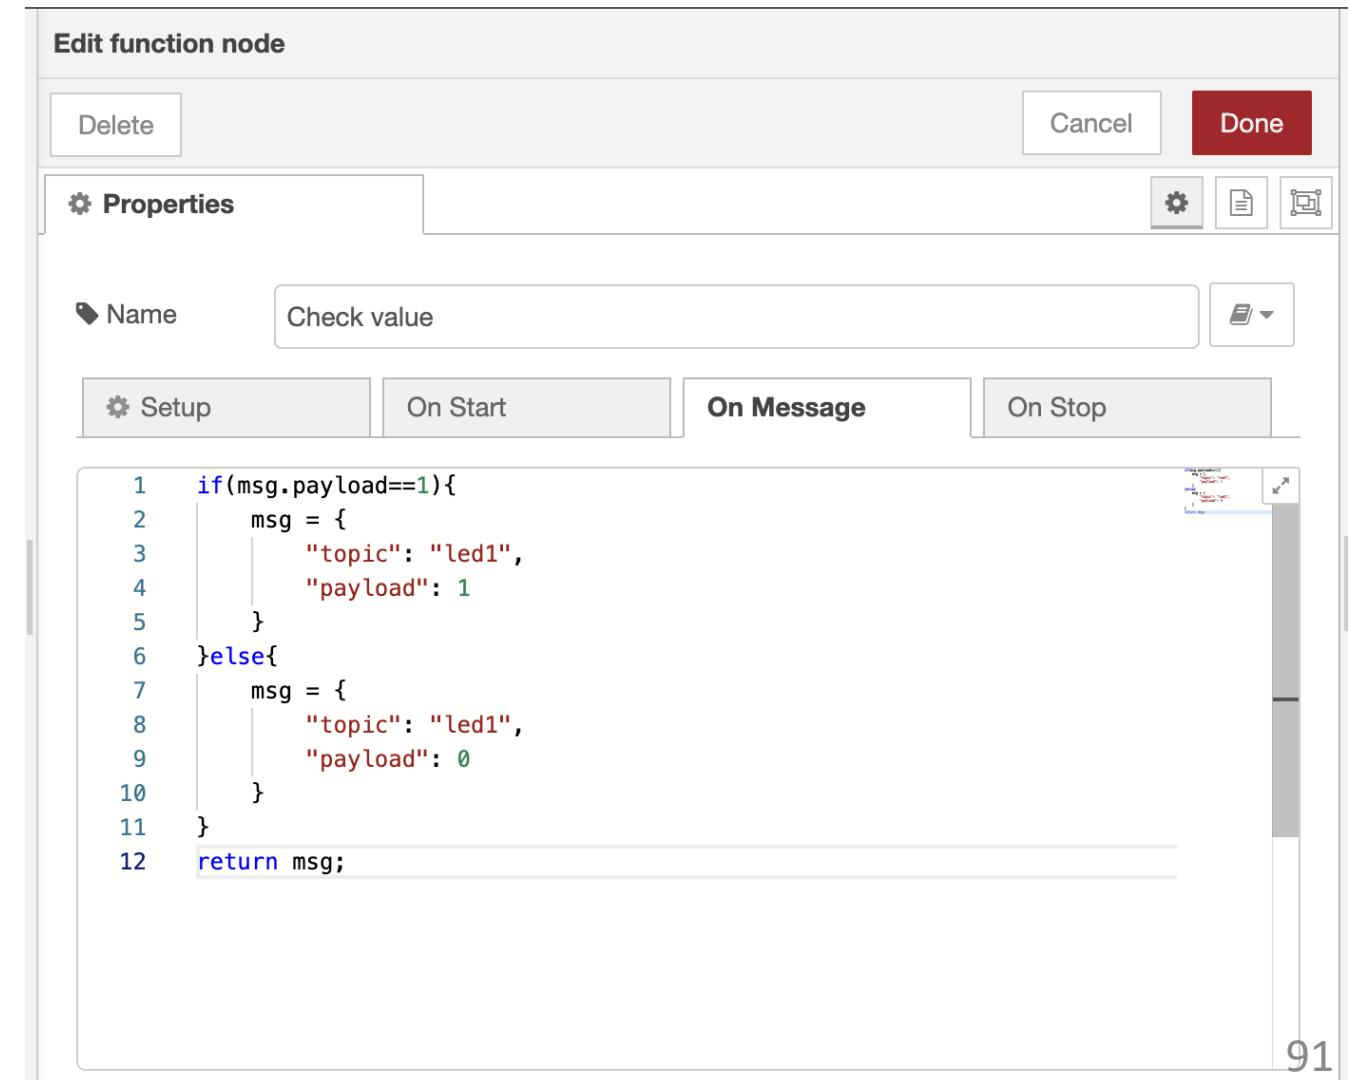

**Node-RED Dashboard with switch button**

## Integrate Switch/Button to the Node-RED Dashboard Nodes.

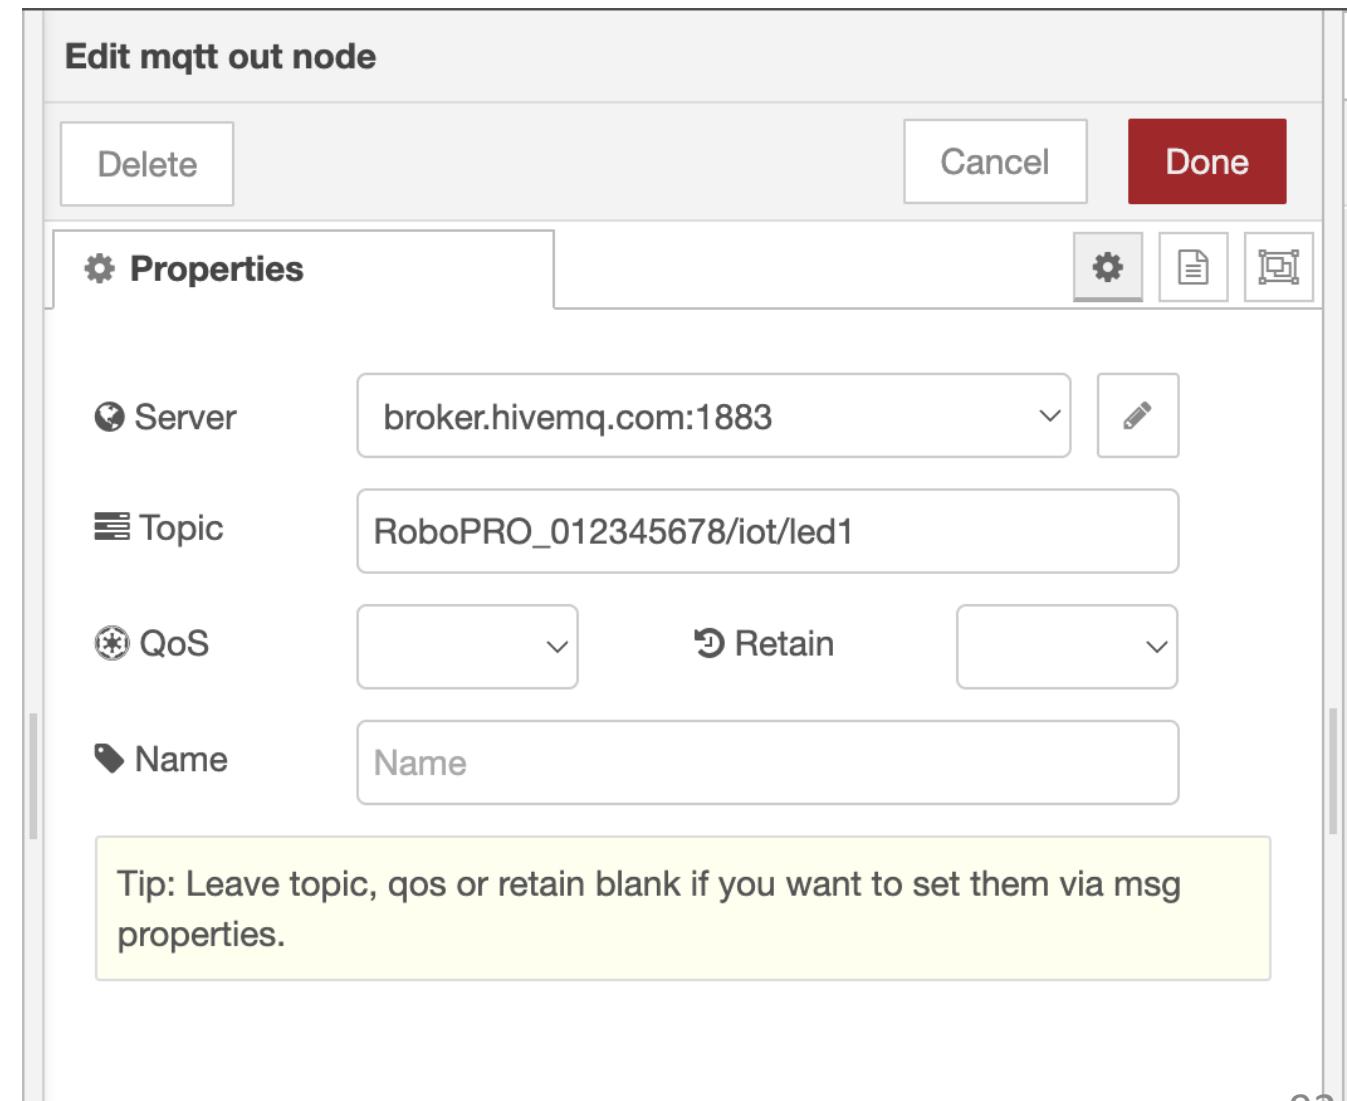

- Insert Dashboard **Switch**, **function**, and **mqtt out** nodes.
- Double click the **switch** node to edit the properties.
- The Label is “**LED 1**”.
- Select the existing group (that you had created before) – eg. *[My First Dashboard] IoT Monitoring*
- Click Done.

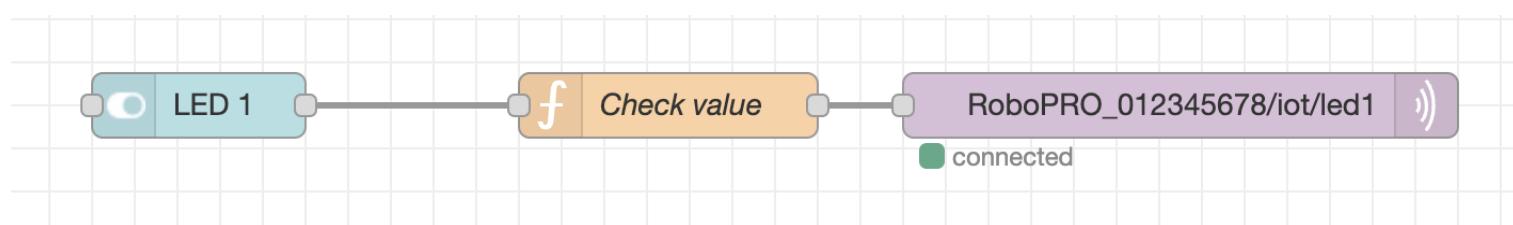

- Double click the **function** node to edit the properties.
- Insert the given code in the **On Message** tab.
- Click Done.

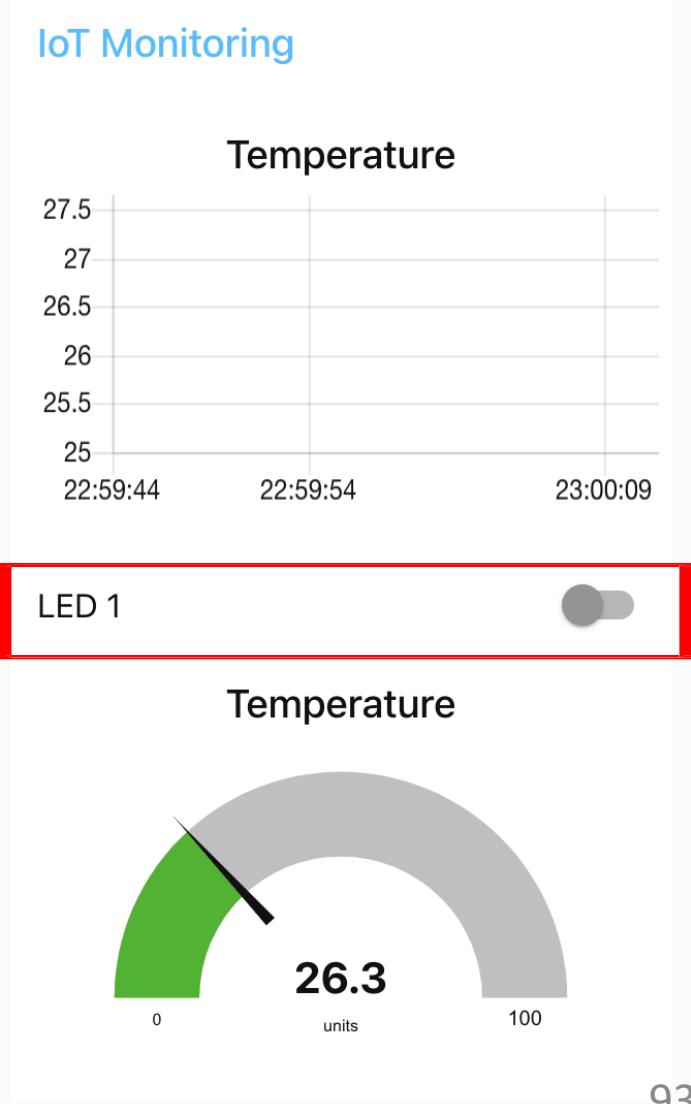

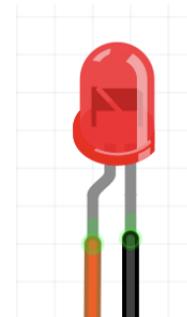

- Double click the **mqtt out** node to edit the properties.
- Select the existing Server (broker.hivemq.com:1883).
- Insert your LED1 topic, eg.: **RoboPRO\_012345678/iot/led1**
- Click **Done**.

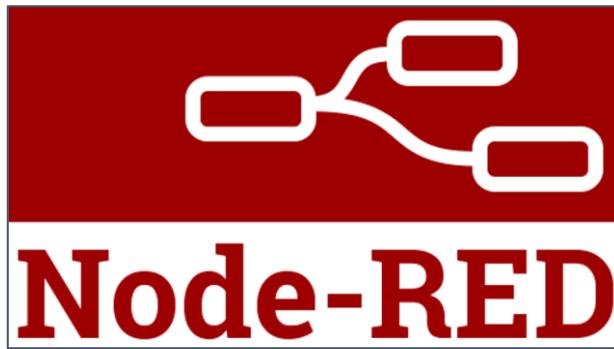

# Controlling UNO from Dashboard

- Connect the nodes.
- Open your dashboard, you will see a switch button labelled “LED 1” will appear.
- Click the **switch** on/off, it will turn your LED on UNO on/off accordingly.
- Check your LED!

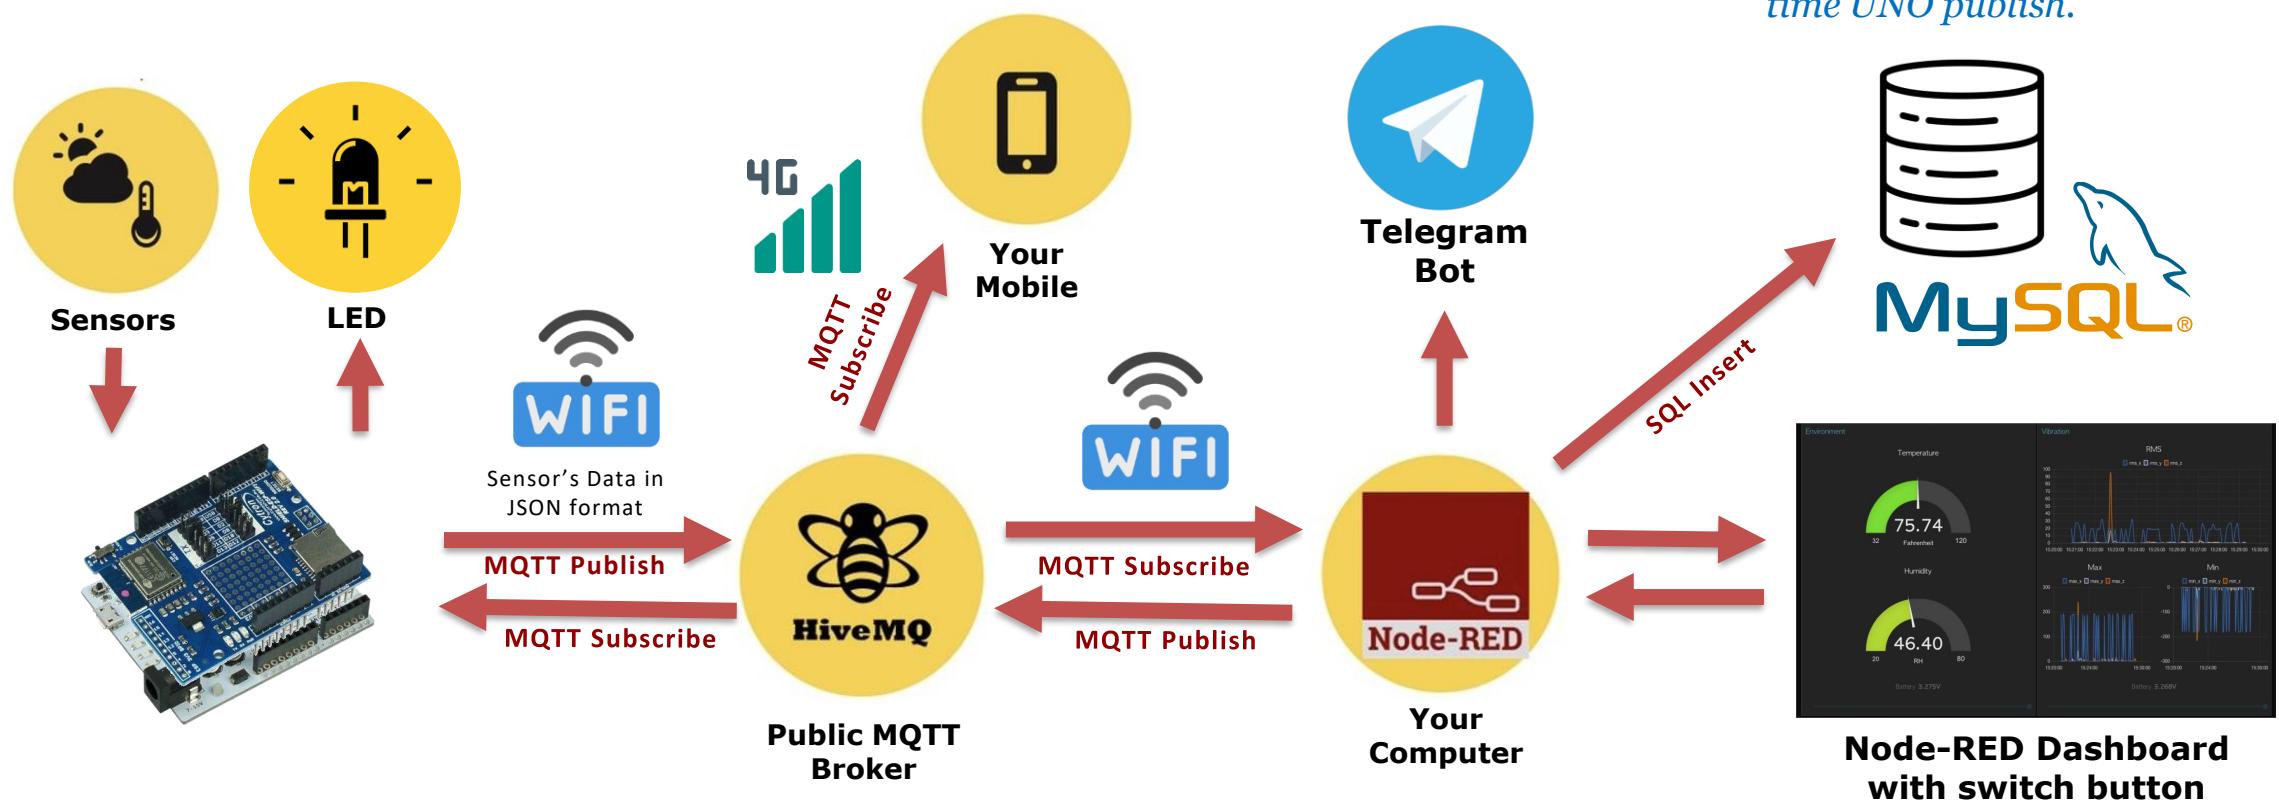

# Node-RED with MySQL

Using Node-RED to read and write data to a MySQL Database.

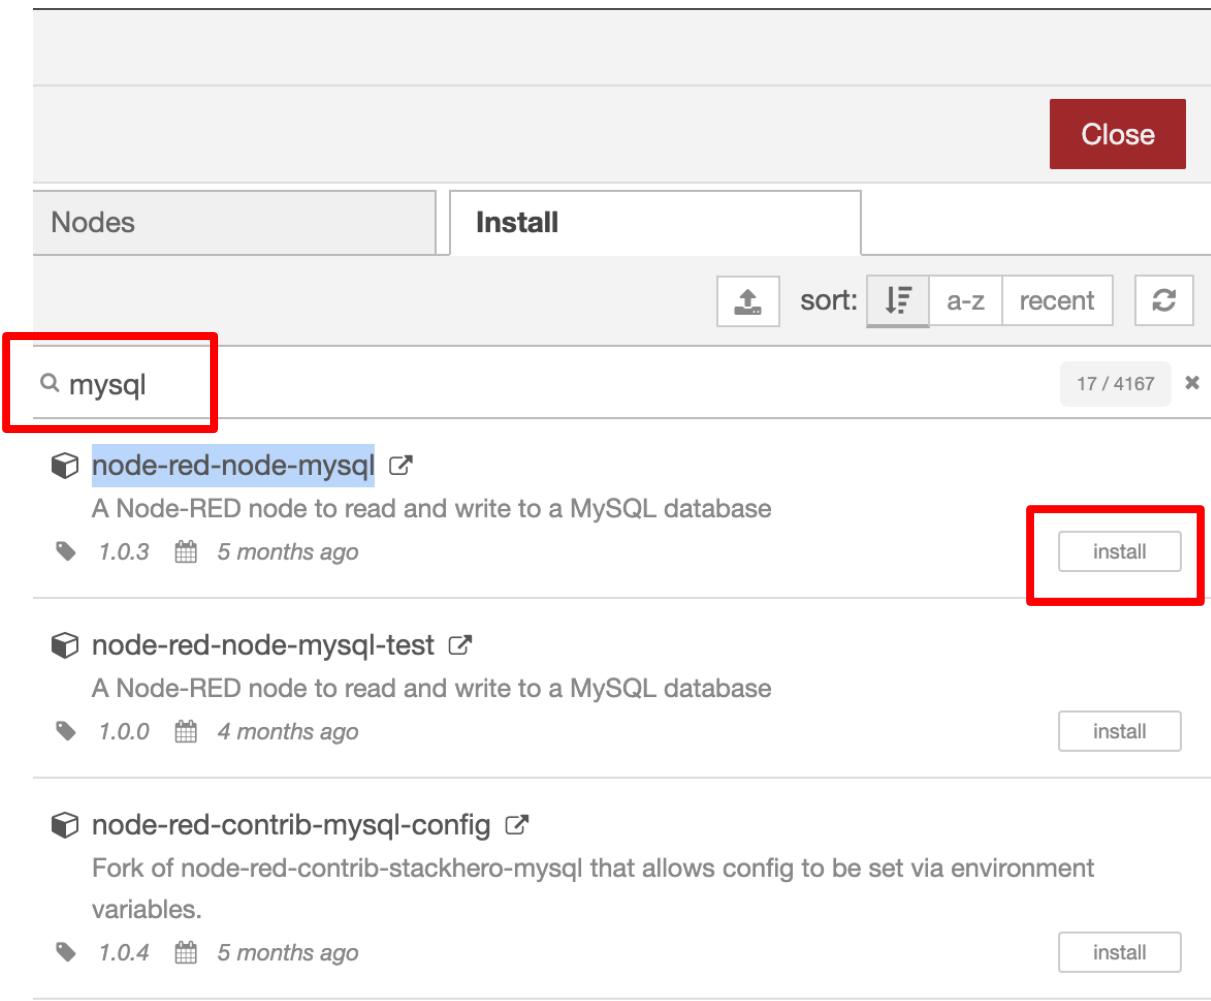

*The connectivity of UNO and Node-RED is via HiveMQ public MQTT broker.*

## The architecture:

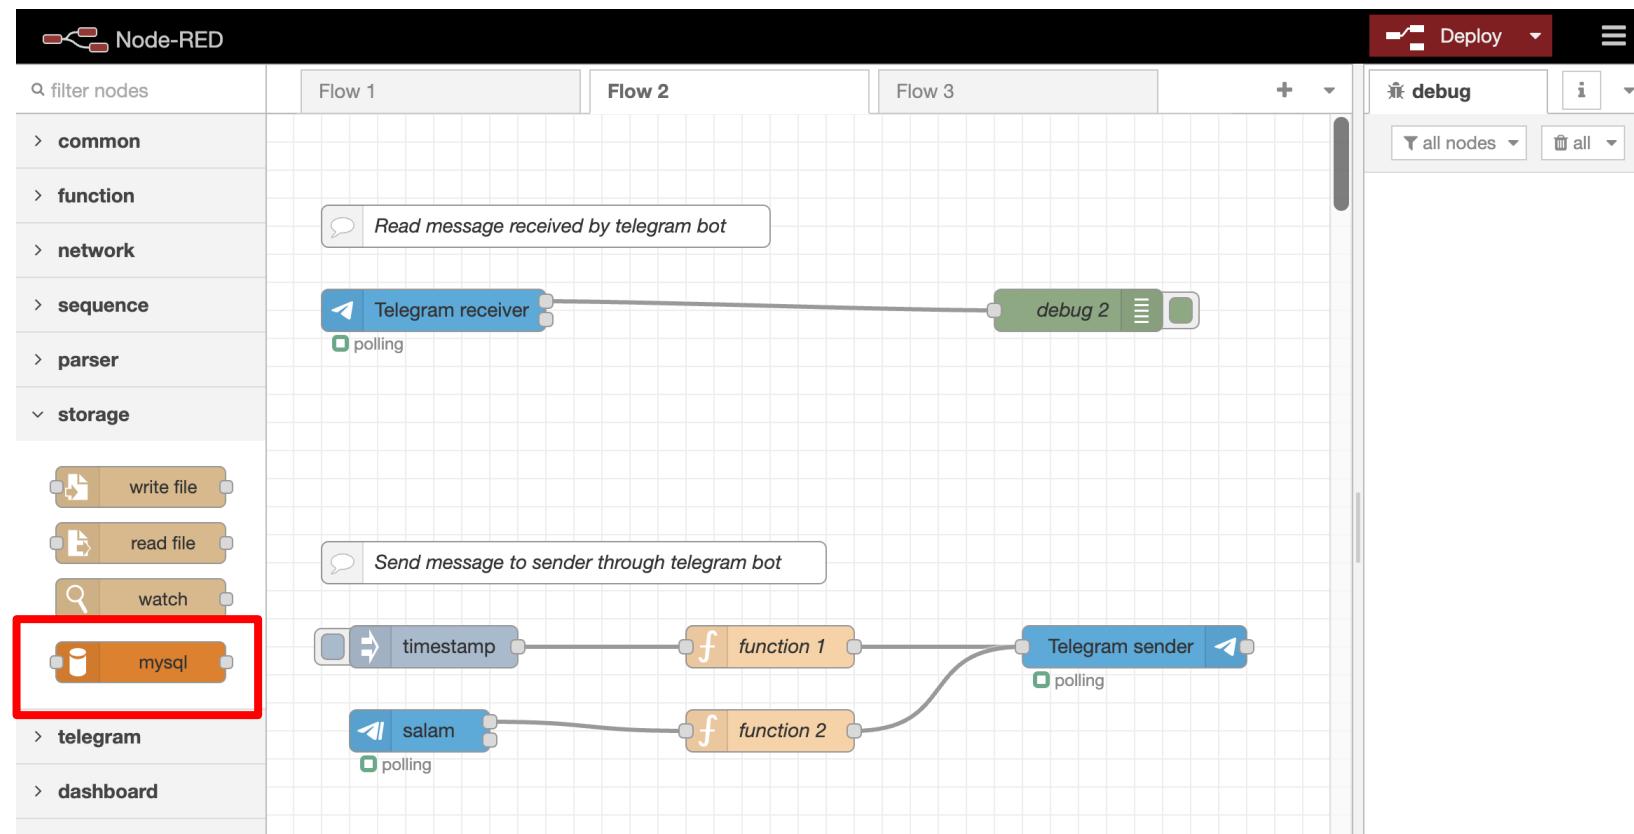

## Install Node-RED Dashboard

- Open Node-RED Palette Manager.
- Click on the **Install** tab and on the **search modules** fields type "**mysql**" to filter the list of the available modules.
- Click the **install** button to install the **node-red-node-mysql** module and wait until the installation process is successful.

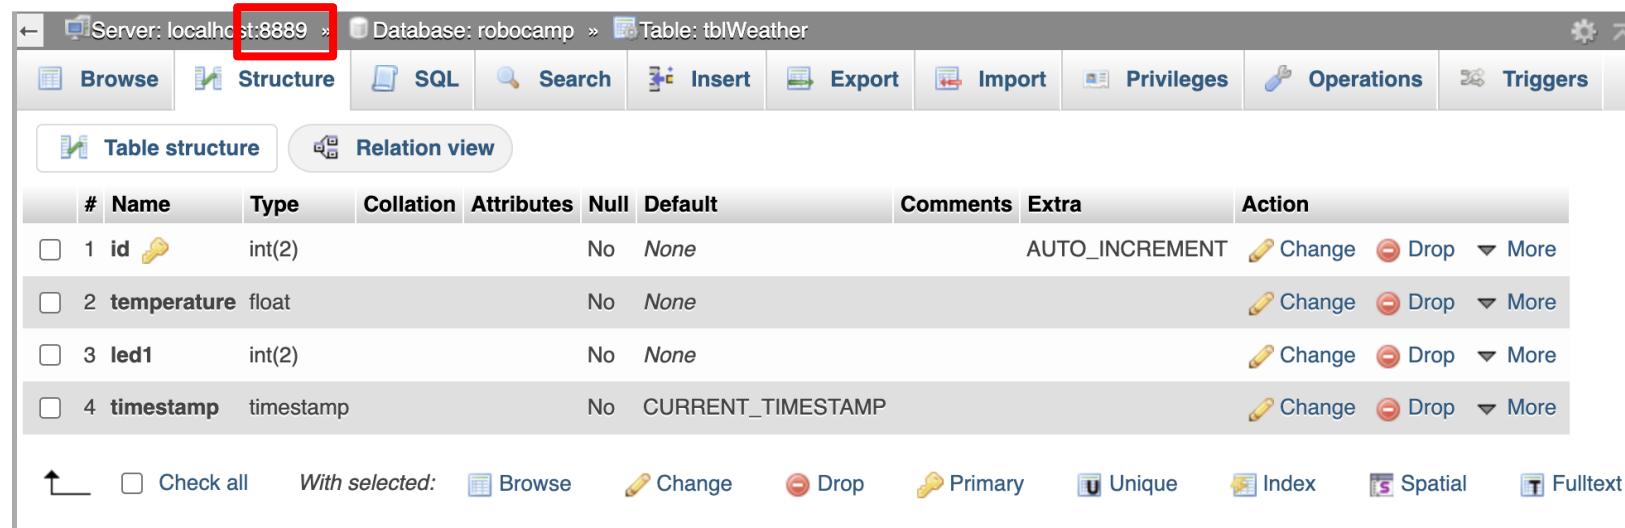

- Once the installation is successful, the mysql node will be available on the palette under an existing category: **storage**.

## Node-RED write data into MySQL table (10 Steps)

1. Make sure you already have MySQL or MariaDB installed on your localhost.
2. Create a new database name “**robocamp**” and a new table name “**tblWeather**” with the same structure as below:

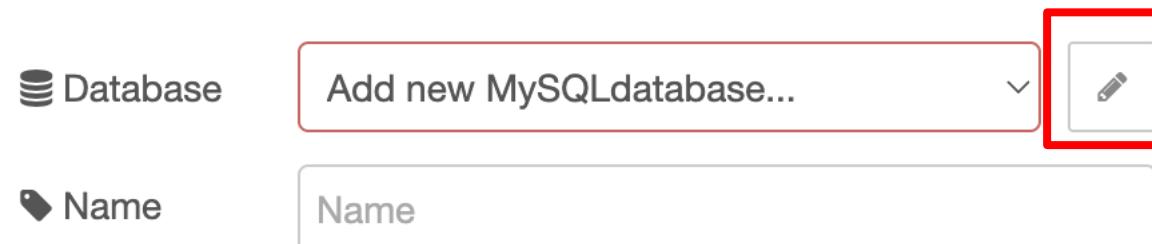

The screenshot shows the MySQL Workbench interface. The title bar indicates the connection is to 'Server: localhost:8889'. The database is 'robocamp' and the table is 'tblWeather'. The 'Table structure' tab is selected. The table has four columns: 'id' (int(2), primary key, auto-increment), 'temperature' (float), 'led1' (int(2)), and 'timestamp' (timestamp, default CURRENT\_TIMESTAMP). Each column has a 'Change' button, a 'Drop' button, and a 'More' dropdown menu.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra	Action
1	<b>id</b>	int(2)			No	None		AUTO_INCREMENT	Change  Drop  More
2	<b>temperature</b>	float			No	None			Change  Drop  More
3	<b>led1</b>	int(2)			No	None			Change  Drop  More
4	<b>timestamp</b>	timestamp			No	CURRENT_TIMESTAMP			Change  Drop  More

3. Keep note on the **port number** of your database. You are going to use it later.

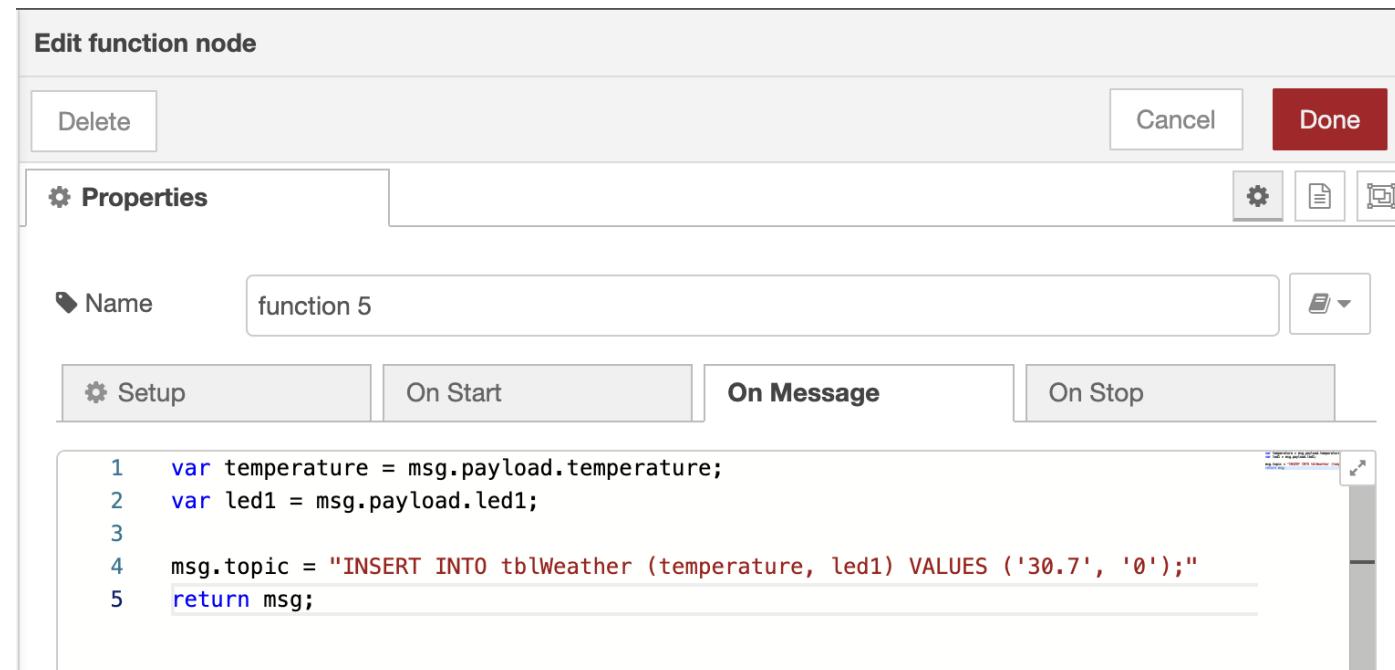

4. Insert **inject**, **function**, **mysql** and **debug** nodes into the workspace.
5. Double click **mysql** node and add *a new MySQL database* by clicking the pencil icon.

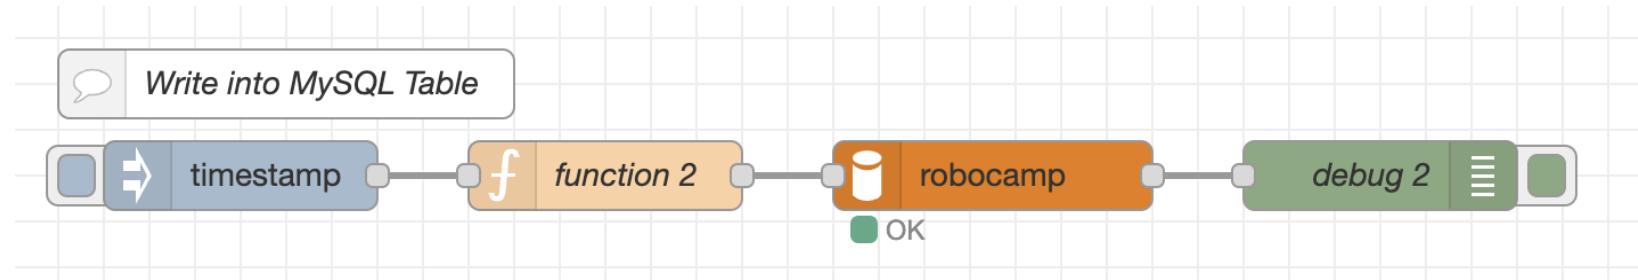

6. Enter the following details:
  - **Host:** 127.0.0.1
  - **Port:** enter the port number from step 3.
  - **User:** enter your MySQL username
  - **Password:** enter your MySQL password
  - **Database:** robocamp
7. Leave other values as default. Click **Add** when finished.

- Double click the **function** node to edit the properties. Insert the given code in the On Message tab. 30.7 and 0 are just dummy value for temperature and LED1. You can use any value that you want.

- Click **Done**.

10. Connect all the nodes. Click **Deploy**. Check your database, a new value should had been inserted in the **tblWeather** table.

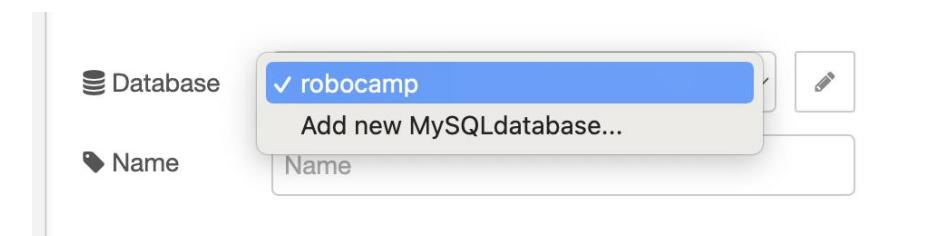

**Note:**

This is how you can store your sensor data into a database. You can also read date from your table by changing the SQL statement in the **function** node.

## Node-RED get MQTT data and write into MySQL table (4 Steps)

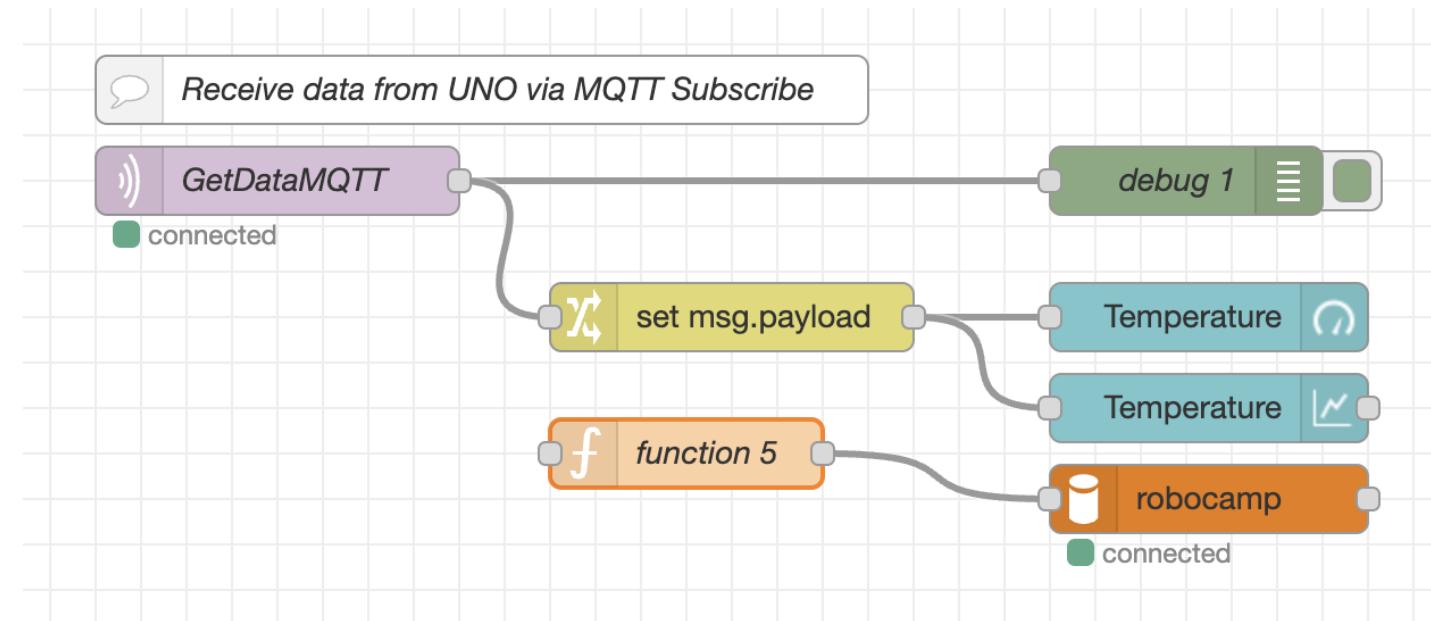

1. Insert **function** and **mysql** nodes into the workspace.
2. Double click **mysql** node and select the existing MySQL database *robocamp*.

- Double click the **function** node to edit the properties. Insert the given code in the On Message tab. Click **Done**.

4. Connect the function node from the existing **mqtt in** node *GetDataMQTT*, and to the new **mysql** node.

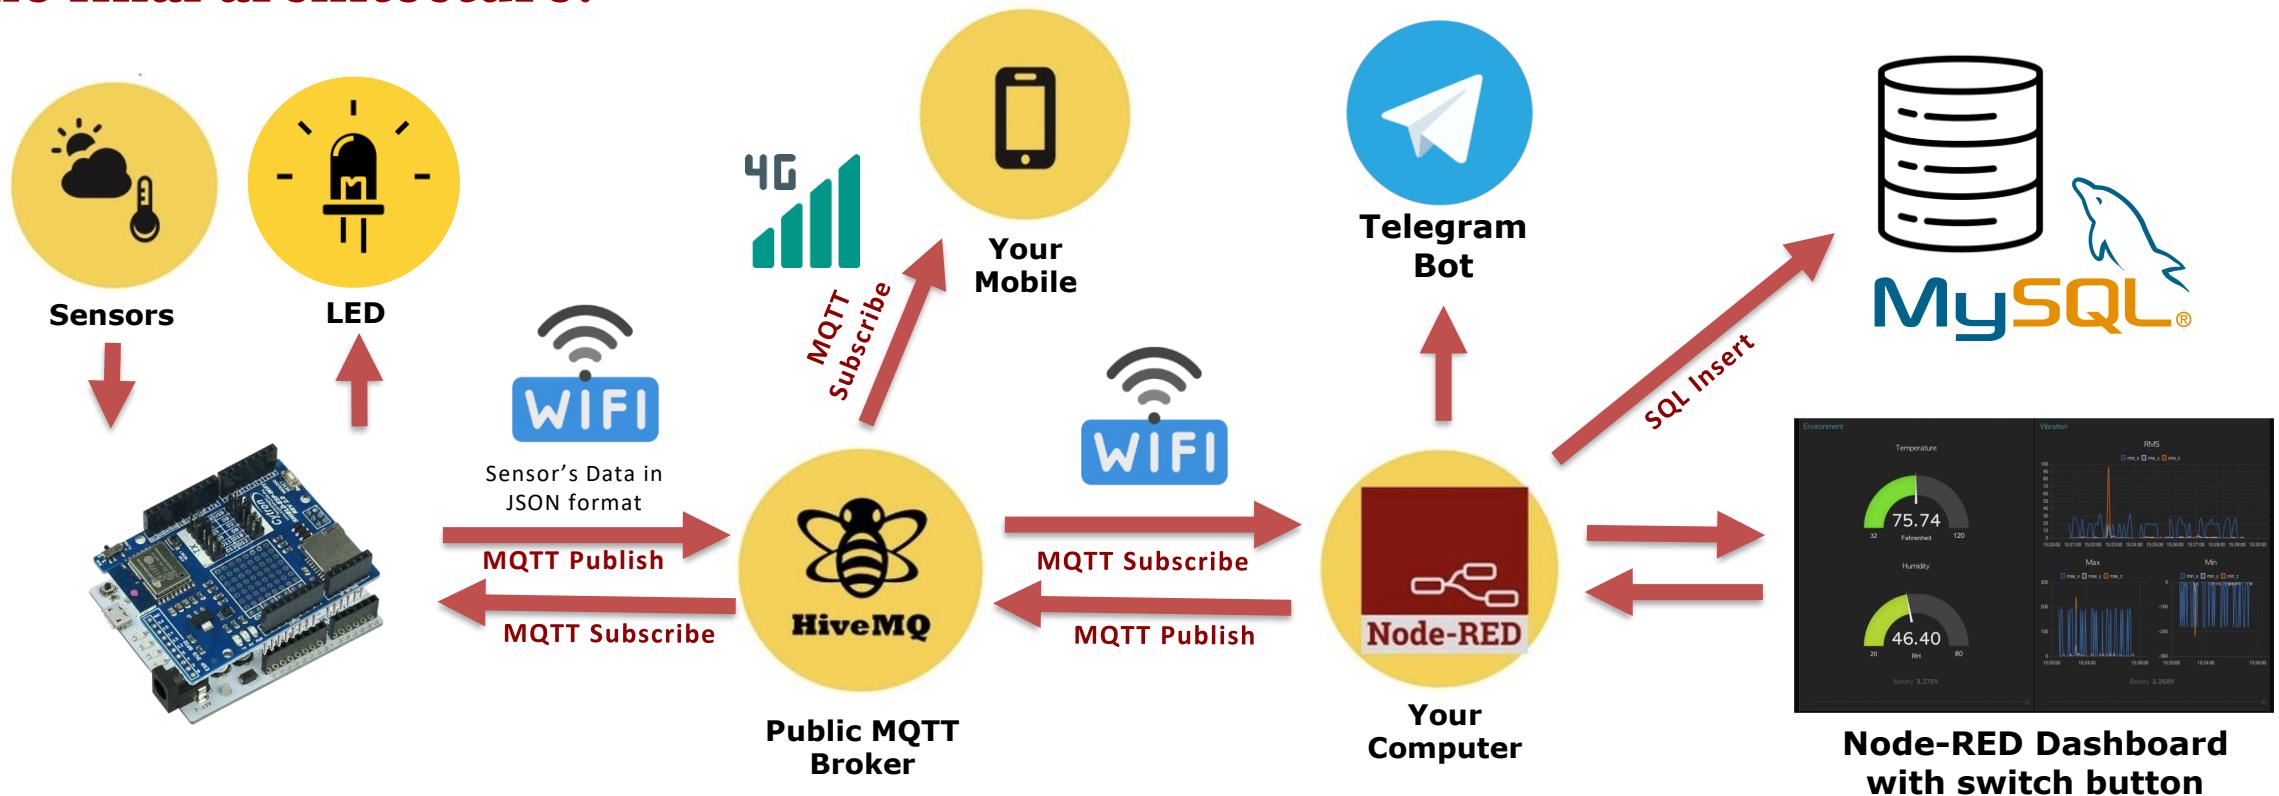

## Note:

Check your database. A new entry should be inserted every time *GetDataMQTT* read new data from your sensors. You can develop a mobile or web application to read the data from the MySQL database and visualize them in a graph/figures, or perhaps produce a meaningful report.

# Wrapping Up!

*What have we learned today?*

**The final architecture:**

**Got it? You can do so much from here. Be creative!**

# That's it!

There is only so much I can teach.

Knowledge is a great treasure that has no limits.

The only limitation is your imagination.

Thank you.

- *Cikgu Fadzli* -
